Issue	Description	Date
1.0.0	First Issue	February 5, 2007
1.1.0	Clock Multiplier changed (X4 instead of X8)	April 4, 2007
1.2.0	Interrupt Wait ioctl function added	June 20, 2007
1.2.1	Support for TAMC863 added	April 8, 2008
1.2.2	Return value of write() function corrected, functionality of the Valid field in TDRV009_DATA_BUFFER clarified.	February 13, 2009
2.0.0	Support for VxBus and API description added	March 2, 2010
2.0.1	Legacy vs. VxBus Driver modified	March 26, 2010

1 Introduction

The TDRV009-SW-42 release contains independent driver sources for the old legacy (pre-VxBus) and the new VxBus-enabled driver model. The VxBus-enabled driver is recommended for new developments with later VxWorks 6.x releases and mandatory for VxWorks SMP systems.

Both drivers, legacy and VxBus, share the same application programming interface (API) and device-independent basic I/O interface with open(), close() and ioctl() functions. The basic I/O interface is only for backward compatibility with existing applications and should not be used for new developments.

Both drivers invoke a mutual exclusion and binary semaphore mechanism to prevent simultaneous requests by multiple tasks from interfering with each other.

The TDRV009-SW-42 device driver supports the following features:

- setup and configure a serial channel
- send data buffers
- receive data buffers (buffer based / character based)

The TDRV009-SW-42 supports the modules listed below:

TPMC863	4 Channel High Speed Synch/Asynch Serial Interface	PMC
TPMC363	4 Channel High Speed Synch/Asynch Serial Interface	PMC, Conduction Cooled
TAMC863	4 Channel High Speed Synch/Asynch Serial Interface	Advanced Mezzanine Card
TCP863	4 Channel High Speed Synch/Asynch Serial Interface	CompactPCI

In this document all supported modules and devices will be called TDRV009. Specials for a certain device will be advised.

To get more information about the features and use of supported devices it is recommended to read the manuals listed below.

- TPMC863 (or compatible) User manual
- TPMC863 (or compatible) Engineering Manual

2 Installation

Following files are located on the distribution media:

Directory path 'TDRV009-SW-42':

TDRV009-SW-42-2.0.1.pdf	PDF copy of this manual
TDRV009-SW-42-VXBUS.zip	Zip compressed archive with VxBus driver sources
TDRV009-SW-42-LEGACY.zip	Zip compressed archive with legacy driver sources
ChangeLog.txt	Release history
Release.txt	Release information

The archive TDRV009-SW-42-VXBUS.zip contains the following files and directories:

Directory path './tews/tdrv009':

tdrv009drv.c	TDRV009 device driver source
tdrv009def.h	TDRV009 driver include file
commCtrl.h	Include file for controller chip
tdrv009.h	TDRV009 include file for driver and application
tdrv009api.c	TDRV009 API file
node.c	Linked list support functions
node.h	Linked list support functions header file
Makefile	Driver Makefile
40tdrv009.cdf	Component description file for VxWorks development tools
tdrv009.dc	Configuration stub file for direct BSP builds
tdrv009.dr	Configuration stub file for direct BSP builds
include/tvxbHal.h	Hardware dependent interface functions and definitions
apps/tdrv009exa.c	Example application

The archive TDRV009-SW-42-LEGACY.zip contains the following files and directories:

Directory path './tdrv009':

tdrv009drv.c	TDRV009 device driver source
tdrv009def.h	TDRV009 driver include file
commCtrl.h	Include file for controller chip
tdrv009.h	TDRV009 include file for driver and application
tdrv009pci.c	TDRV009 PCI MMU mapping for Intel x86 based targets
tdrv009exa.c	Example application
node.c	Linked list support functions
node.h	Linked list support functions header file
include/tdhal.h	Hardware dependent interface functions and definitions

2.1 Legacy vs. VxBus Driver

In later VxWorks 6.x releases, the old VxWorks 5.x legacy device driver model was replaced by VxBus-enabled device drivers. Legacy device drivers are tightly coupled with the BSP and the board hardware. The VxBus infrastructure hides all BSP and hardware differences under a well defined interface, which improves the portability and reduces the configuration effort. A further advantage is the improved performance of API calls by using the method interface and bypassing the VxWorks basic I/O interface.

VxBus-enabled device drivers are the preferred driver interface for new developments.

The checklist below will help you to make a decision which driver model is suitable and possible for your application:

Legacy Driver	VxBus Driver
<ul style="list-style-type: none"> ▪ VxWorks 5.x releases ▪ VxWorks 6.5 and earlier releases ▪ VxWorks 6.x releases without VxBus PCI bus support 	<ul style="list-style-type: none"> ▪ VxWorks 6.6 and later releases with VxBus PCI bus ▪ SMP systems (only the VxBus driver is SMP safe!)

TEWS TECHNOLOGIES recommends not using the VxBus Driver before VxWorks release 6.6. In previous releases required header files are missing and the support for 3rd-party drivers may not be available.

2.2 VxBus Driver Installation

Because Wind River doesn't provide a standard installation method for 3rd party VxBus device drivers the installation procedure needs to be done manually.

In order to perform a manual installation extract all files from the archive TDRV009-SW-42-VXBUS.zip to the typical 3rd party directory *installDir/vxworks-6.x/target/3rdparty* (whereas *installDir* must be substituted by the VxWorks installation directory).

After successful installation the TDRV009 device driver is located in the vendor and driver-specific directory *installDir/vxworks-6.x/target/3rdparty/tews/tdrv009*.

At this point the TDRV009 driver is not configurable and cannot be included with the kernel configuration tool in a Wind River Workbench project. To make the driver configurable the driver library for the desired processor (CPU) and build tool (TOOL) must be built in the following way:

- (1) Open a VxWorks development shell (e.g. C:\WindRiver\wrenv.exe -p vxworks-6.7)
- (2) Change into the driver installation directory
installDir/vxworks-6.x/target/3rdparty/tews/tdrv009
- (3) Invoke the build command for the required processor and build tool
make CPU=cpuName TOOL=tool

For Windows hosts this may look like this:

```
C:> cd \WindRiver\vxworks-6.7\target\3rdparty\tews\tdrv009
```

```
C:> make CPU=PENTIUM4 TOOL=diab
```

To compile SMP-enabled libraries, the argument `VXBUILD=SMP` must be added to the command line.

```
C:> make CPU=PENTIUM4 TOOL=diab VXBUILD=SMP
```

To integrate the TDRV009 driver with the VxWorks development tools (Workbench), the component configuration file `40tdrv009.cdf` must be copied to the directory `installDir/vxworks-6.x/target/config/comps/VxWorks`.

```
C:> cd \WindRiver\vxworks-6.7\target\3rdparty\tews\tdrv009
C:> copy 40tdrv009.cdf \Windriver\vxworks-6.7\target\config\comps\vxWorks
```

In VxWorks 6.7 and newer releases the kernel configuration tool scans the CDF file automatically and updates the `CxrCat.txt` cache file to provide component parameter information for the kernel configuration tool as long as the timestamp of the copied CDF file is newer than the one of the `CxrCat.txt`. If your copy command preserves the timestamp, force to update the timestamp by a utility, such as `touch`.

In earlier VxWorks releases the `CxrCat.txt` file may not be updated automatically. In this case, remove or rename the original `CxrCat.txt` file and invoke the make command to force recreation of this file.

```
C:> cd \Windriver\vxworks-6.7\target\config\comps\vxWorks
C:> del CxrCat.txt
C:> make
```

After successful completion of all steps above and restart of the Wind River Workbench, the TDRV009 driver can be included in VxWorks projects by selecting the “*TEWS TDRV009 Driver*” component in the “*hardware (default) - Device Drivers*” folder with the kernel configuration tool.

2.2.1 Direct BSP Builds

In development scenarios with the direct BSP build method without using the Workbench or the `vxprj` command-line utility, the TDRV009 configuration stub files must be copied to the directory `installDir/vxworks-6.x/target/config/comps/src/hwif`. Afterwards the `vx_usrCmdLine.c` file must be updated by invoking the appropriate make command.

```
C:> cd \WindRiver\vxworks-6.7\target\3rdparty\tews\tdrv009
C:> copy tdrv009.dc \Windriver\vxworks-6.7\target\config\comps\src\hwif
C:> copy tdrv009.dr \Windriver\vxworks-6.7\target\config\comps\src\hwif

C:> cd \Windriver\vxworks-6.7\target\config\comps\src\hwif
C:> make vx_usrCmdLine.c
```

2.3 Legacy Driver Installation

2.3.1 Include device driver in VxWorks projects

For including the TDRV009-SW-42 device driver into a VxWorks project (e.g. Tornado IDE or Workbench) follow the steps below:

- (1) Extract all files from the archive TDRV009-SW-42-LEGACY.zip to your project directory.
- (2) Add the device drivers C-files to your project.
Make a right click to your project in the 'Workspace' window and use the 'Add Files ...' topic. A file select box appears, and the driver files in the tdrv009 directory can be selected.
- (3) Now the driver is included in the project and will be built with the project.

For a more detailed description of the project facility please refer to your VxWorks User's Guide (e.g. Tornado, Workbench, etc.)

2.3.2 Special installation for Intel x86 based targets

The TDRV009 device driver is fully adapted for Intel x86 based targets. This is done by conditional compilation directives inside the source code and controlled by the VxWorks global defined macro **CPU_FAMILY**. If the content of this macro is equal to *IBOX86* special Intel x86 conforming code and function calls will be included.

The second problem for Intel x86 based platforms can't be solved by conditional compilation directives. Due to the fact that some Intel x86 BSP's doesn't map PCI memory spaces of devices which are not used by the BSP, the required device memory spaces can't be accessed.

To solve this problem a MMU mapping entry has to be added for the required TDRV009 PCI memory spaces prior the MMU initialization (*usrMmulnit()*) is done.

The C source file **tdrv009pci.c** contains the function *tdrv009Pcilnit()*. This routine finds out all TDRV009 devices and adds MMU mapping entries for all used PCI memory spaces. Please insert a call to this function after the PCI initialization is done and prior to MMU initialization (*usrMmulnit()*).

The right place to call the function *tdrv009Pcilnit()* is at the end of the function *sysHwlnit()* in **sysLib.c** (it can be opened from the project *Files* window).

Be sure that the function is called prior to MMU initialization otherwise the TDRV009 PCI spaces remains unmapped and an access fault occurs during driver initialization.

Please insert the following call at a suitable place in **sysLib.c**:

```
tdrv009PciInit();
```

Modifying the sysLib.c file will change the sysLib.c in the BSP path. Remember this for future projects and recompilations.

2.3.3 BSP dependent adjustments

The driver includes a file called *include/tdhal.h* which contains functions and definitions for BSP adaptation. It may be necessary to modify them for BSP specific settings. Most settings can be made automatically by conditional compilation set by the BSP header files, but some settings must be configured manually. There are two ways of modification, first you can change the *include/tdhal.h* and define the corresponding definition and its value, or you can do it, using the command line option *-D*.

There are 3 offset definitions (*USERDEFINED_MEM_OFFSET*, *USERDEFINED_IO_OFFSET*, and *USERDEFINED_LEV2VEC*) that must be configured if a corresponding warning message appears during compilation. These definitions always need values. Definition values can be assigned by command line option *-D<definition>=<value>*.

definition	description
<i>USERDEFINED_MEM_OFFSET</i>	The value of this definition must be set to the offset between CPU-Bus and PCI-Bus Address for PCI memory space access
<i>USERDEFINED_IO_OFFSET</i>	The value of this definition must be set to the offset between CPU-Bus and PCI-Bus Address for PCI I/O space access
<i>USERDEFINED_LEV2VEC</i>	The value of this definition must be set to the difference of the interrupt vector (used to connect the ISR) and the interrupt level (stored to the PCI header)

Another definition allows a simple adaptation for BSPs that utilize a *pciIntConnect()* function to connect shared (PCI) interrupts. If this function is defined in the used BSP, the definition of *USERDEFINED_SEL_PCIINTCONNECT* should be enabled. The definition by command line option is made by *-D<definition>*.

Please refer to the BSP documentation and header files to get information about the interrupt connection function and the required offset values.

2.4 System resource requirement

The table gives an overview over the system resources that will be needed by the driver.

Resource	Driver requirement	Devices requirement
Memory	< 1 KB	depends on FIFO size
Stack	< 1 KB	---

Memory and Stack usage may differ from system to system, depending on the used compiler and its setup.

The following formula shows the way to calculate the common requirements of the driver and devices.

$$\langle total\ requirement \rangle = \langle driver\ requirement \rangle + (\langle number\ of\ devices \rangle * \langle device\ requirement \rangle)$$

The maximum usage of some resources is limited by adjustable parameters. If the application and driver exceed these limits, increase the according values in your project.

3 API Documentation

3.1 General Functions

3.1.1 tdrv009Open()

Name

tdrv009Open() – open a device.

Synopsis

```
TDRV009_DEV tdrv009Open  
(  
    char      *DeviceName  
)
```

Description

Before I/O can be performed to a device, a file descriptor must be opened by a call to this function.

Parameters

DeviceName

This parameter points to a null-terminated string that specifies the name of the device. The first TDRV009 channel device is named "/tdrv009/0", the second channel device is named "/tdrv009/1" and so on.

Example

```
#include "tdrv009.h"  
  
TDRV009_DEV    pDev;  
  
/*  
** open file descriptor to device  
*/  
pDev = tdrv009Open("/tdrv009/0");  
if (pDev == NULL)  
{  
    /* handle open error */  
}
```

RETURNS

A device descriptor pointer, or NULL if the function fails. An error code will be stored in *errno*.

ERROR CODES

The error codes are stored in *errno*.

The error code is a standard error code set by the I/O system.

3.1.2 tdrv009Close()

Name

tdrv009Close() – close a device.

Synopsis

```
int tdrv009Close
(
    TDRV009_DEV    pDev
)
```

Description

This function closes previously opened devices.

Parameters

pDev

This value specifies the file descriptor pointer to the hardware module retrieved by a call to the corresponding open-function.

Example

```
#include "tdrv009.h"

TDRV009_DEV    pDev;
int            result;

/*
** close file descriptor to device
*/
result = tdrv009Close(pDev);
if (result < 0)
{
    /* handle close error */
}
```

RETURNS

Zero, or -1 if the function fails. An error code will be stored in *errno*.

ERROR CODES

The error codes are stored in *errno*.

The error code is a standard error code set by the I/O system.

3.2 Device Access Functions

3.2.1 tdrv009Read

Name

tdrv009Read – Read data from device

Synopsis

```
int tdrv009Read
(
    TDRV009_DEV      pDev,
    unsigned char    *pData,
    int              nBytes
)
```

Description

This function reads data from the device. The data is returned on a byte basis, no frame information is returned. The function returns immediately after copying either the available or the requested amount of data.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pData

This argument points to a user supplied buffer. The data will be copied into this buffer.

nBytes

This parameter specifies the maximum number of bytes to be read (buffer size).

Example

```
#include "tdrv009.h"

TDRV009_DEV      pDev;
int              retval;
unsigned char    buffer[100];

/*-----
   Read up to 100 bytes from TDRV009 channel
   -----*/

retval = tdrv009Read( pDev, buffer, 100 );
if (retval != ERROR)
{
    printf("%d bytes read\n", retval);
    printf("data = %s\n", buffer);
}
else
{
    /* Handle Error */
}
```

RETURNS

Number of bytes read or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified.

3.2.2 tdrv009FrameRead

Name

tdrv009FrameRead – Read data from a specified device

Synopsis

```
STATUS tdrv009FrameRead
(
    TDRV009_DEV          pDev,
    TDRV009_DATA_BUFFER *pDataBuffer
)
```

Description

This function reads one data buffer from the internal receive buffer. The function will return immediately, if data is available. If no data is available, the function will wait until data arrives, or the specified timeout occurs. The returned data buffer will be available until the next call to this I/O control function.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pDataBuffer

This parameter is a pointer to a *TDRV009_DATA_BUFFER* structure describing the data to read.

```
typedef struct
{
    unsigned char *pData;
    unsigned long Length;
    unsigned long Valid;
    int Overflow;
    int Timeout;
} TDRV009_DATA_BUFFER;
```

pData

Pointer to the receive data section. This pointer directly references the driver's internal receive buffer. It points to the beginning of the corresponding data frame. Do not free the associated memory section!

Length

Number of valid data bytes for this data buffer.

Valid

This value specifies if the corresponding data buffer contains valid data, or if the read data buffer also contains a “Frame End”. The given values can be binary OR’ed. Possible values are:

Value	Description
TDRV009_RXBUF_DATAVALID	Current data block contains valid (unread) data.
TDRV009_RXBUF_FRAMEEND	Current data block is the last one of a received data frame.

Overflow

This value specifies if a buffer overrun has happened. The automatically stopped receiver is enabled again after the read access.

Timeout

This value specifies the maximum time to wait for incoming data. The timeout is specified in system ticks.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;
TDRV009_DATA_BUFFER DataBuf;

/*-----
  Read a data buffer. Wait max. 120 ticks.
  -----*/
DataBuf.Timeout = 120;

retval = tdrv009FrameRead(pDev, &DataBuf);
if (retval == OK)
{
    /* function succeeded */
    printf( "%d data bytes received.\n", DataBuf.Length );
    if (DataBuf.Overflow)
    {
        printf( "Data was lost due to a buffer overflow.\n" );
    }
}
else {
    /* handle the write error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified. The supplied buffer pointer is NULL.
EBUSY	The channel is currently busy with another write operation.
ENOMEM	Not enough memory to queue this transmission.
EIO	Failed to initialize the transmitter.

3.2.3 tdrv009Write

Name

tdrv009Write – Write data from a buffer to a specified device

Synopsis

```
STATUS tdrv009Write
(
    TDRV009_DEV          pDev,
    unsigned char        *pData,
    int                  nBytes
)
```

Description

This function can be used to write data to the device. The function returns immediately to the caller after queuing the data into the transmit descriptor list. Make sure that the supplied data buffer persists until the transmission is completed. To check if the data buffer is completely processed, namely the data has been transferred to the hardware FIFO, use the API function `tdrv009WriteBufDone` (see below).

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pData

This argument points to a user supplied buffer. The data of the buffer will be written to the device. The data buffer must be physically contiguous and accessible by the DMA controller.

nBytes

This parameter specifies the maximum number of bytes to write.

Example

```
#include "tdrv009.h"

TDRV009_DEV      pDev;
int              retval;
unsigned char    *pData;

/*-----
   Write data to a TDRV009 device
   -----*/
pData = (char*)cacheDmaMalloc( 12 );
sprintf( (char*)pData, "Hello World" );

retval = tdrv009Write(pDev, buffer, 12);
if (retval == OK)
{
    printf("Data queued for transmission.\n");
}
else
{
    /* handle the write error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified.

3.2.4 tdrv009FrameWrite

Name

tdrv009FrameWrite – Write data from a buffer to a specified device

Synopsis

```
STATUS tdrv009FrameWrite
(
    TDRV009_DEV          pDev,
    TDRV009_TX_DATA_BUFFER *pDataBuffer
)
```

Description

This function transmits one data buffer. The function will return immediately after handing over the buffer to the driver. It is possible to wait until the supplied data buffer is transferred to the hardware FIFO. This can be done either by waiting on the specified semaphore, or by polling the status parameter.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pDataBuffer

This parameter is a pointer to a *TDRV009_TX_DATA_BUFFER* structure describing the data to be sent.

```
typedef struct
{
    unsigned char *pData;
    unsigned long Length;
    unsigned long Status;
    SEM_ID WaitSema;
} TDRV009_TX_DATA_BUFFER;
```

pData

Pointer to the data section containing the data to be transmitted. This buffer must be physically coherent. Make sure that the data buffer is not modified during transmission.

Length

Number of data bytes for this data buffer.

Status

This value contains the current status of this transmit data packet. Possible values are:

Value	Description
TDRV009_TXDATA_BUSY	Data buffer is currently in use. Do not modify it.
TDRV009_TXDATA_COMPLETED	Data buffer is completed. The data is at least transferred into the hardware FIFO.

WaitSema

This value holds a semaphore created by the user. This semaphore will be signaled after the data buffer is processed.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval, result;
unsigned char        *pData;
TDRV009_TX_DATA_BUFFER TxDataBuf;

/*-----
   Send a data buffer. Wait max. 120 ticks for completion
   -----*/
pData = (unsigned char*)cacheDmaMalloc( 20*sizeof(unsigned char) );
sprintf((char*)pData, "Hello World!");

TxDataBuf.Status     = 0;
TxDataBuf.WaitSema  = semBCreate(SEM_Q_FIFO, SEM_EMPTY);
TxDataBuf.pData     = pData;
TxDataBuf.Length    = strlen((char*)pData);

retval = tdrv009FrameWrite(pDev, &TxDataBuf);
if (retval == OK)
{
    /*
     ** function succeeded, wait for completion of the data packet.
     */
    result = semTake( TxDataBuf.WaitSema, 120 );
}
```

```
    if (result == OK)
    {
        printf( "data buffer processed\n" );
    }
    else
    {
        printf( "data buffer still busy\n" );
    }
}
else
{
    /* handle the write error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified. The supplied buffer pointer is NULL.
EBUSY	The channel is currently busy with another write operation.
ENOMEM	Not enough memory to queue this transmission.
EIO	Failed to initialize the transmitter.

3.2.5 tdrv009WriteBufDone

Name

tdrv009WriteBufDone – Write data from a buffer to a specified device

Synopsis

```
STATUS tdrv009WriteBufDone
(
    TDRV009_DEV          pDev,
    unsigned char        *pData
)
```

Description

This function checks the current state of a transmit data buffer, which was previously handed over to the driver using the `tdrv009Write()` function. If the buffer has already been processed (i.e. data was transferred to the hardware FIFO), the function returns OK. If the buffer has not been processed, the function will return ERROR with an appropriate error code.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pData

This argument points to a user supplied buffer, which has previously been queued for transmission using function `tdrv009Write()`.

Example

```
#include "tdrv009.h"

TDRV009_DEV      pDev;
int              retval;
unsigned char    *pData;

/*-----
   send TX data buffer
   -----*/
pData = (char*)cacheDmaMalloc(...);
...
retval = tdrv009Write(pDev, pData, ...);
...

/*-----
   check state of a TX data buffer
   -----*/
retval = tdrv009WriteBufDone(pDev, buffer);
if (retval == OK)
{
    printf( "Data buffer completed.\n" );
}
else
{
    /* handle the error */
}
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified.

3.2.6 tdrv009SetOperationMode

Name

tdrv009SetOperationMode – Configure channel operation mode

Synopsis

```
STATUS tdrv009SetOperationMode
(
    TDRV009_DEV                pDev,
    TDRV009_OPERATION_MODE_STRUCT *pOperationMode
)
```

Description

This function configures the channel's operation mode.

A call to this function must be done prior to any communication operation, because after driver startup, the channel's transceivers are disabled.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pOperationMode

This argument points to a TDRV009_OPERATION_MODE_STRUCT structure. It is necessary to completely initialize the structure. This can be done by calling the API function tdrv009GetOperationMode described below.

```

typedef struct
{
    TDRV009_COMM_TYPE           CommType;
    TDRV009_TRANSCEIVER_MODE   TransceiverMode;
    TDRV009_ENABLE_DISABLE     Oversampling;
    TDRV009_BRGSOURCE          BrgSource;
    TDRV009_TXCSOURCE          TxClkSource;
    unsigned long               TxClkOutput;
    TDRV009_RXCSOURCE          RxClkSource;
    TDRV009_CLKMULTIPLIER      ClockMultiplier;
    unsigned long               Baudrate;
    unsigned char               ClockInversion;
    unsigned char               Encoding;
    TDRV009_PARITY              Parity;
    int                          Stopbits;
    int                          Databits;
    TDRV009_ENABLE_DISABLE     UseTermChar;
    char                         TermChar;
    TDRV009_ENABLE_DISABLE     HwHs;
    TDRV009_CRC                 Crc;
} TDRV009_OPERATION_MODE_STRUCT;

```

CommType

This parameter describes the general communication type for the specific channel. Possible values are:

Value	Description
TDRV009_COMMTYPE_ASYNC	Asynchronous communication
TDRV009_COMMTYPE_HDLC_ADDR0	Standard HDLC communication without address recognition. Used for synchronous communication.
TDRV009_COMMTYPE_HDLC TRANSP	Extended Transparent mode. No protocol processing, channel works as simple bit collector.

TransceiverMode

This parameter describes the transceiver mode of the programmable multi-protocol transceivers. Possible values are:

Value	Description
TDRV009_TRNSCVR_NOT_USED	Default V.11
TDRV009_TRNSCVR_RS530A	EIA-530A (V.11 / V.10)
TDRV009_TRNSCVR_RS530	EIA-530 (V.11), also suitable for RS422
TDRV009_TRNSCVR_X21	X.21 (V.11)
TDRV009_TRNSCVR_V35	V.35 (V.35 / V.28)
TDRV009_TRNSCVR_RS449	EIA-449 (V.11)
TDRV009_TRNSCVR_V36	V.36 (V.11)
TDRV009_TRNSCVR_RS232	EIA-232 (V.28)
TDRV009_TRNSCVR_V28	V.28 (V.28)
TDRV009_TRNSCVR_NO_CABLE	High impedance

Oversampling

This parameter enables or disables 16times oversampling, used for asynchronous communication. For communication with standard UARTs it is recommended to enable this feature. Valid values are:

Value	Description
TDRV009_DISABLED	The 16 times oversampling is not used.
TDRV009_ENABLED	The 16 times oversampling is used.

BrgSource

This parameter specifies the frequency source used as input to the BRG (Baud Rate Generator). Valid values are:

Value	Description
TDRV009_BRGSRC_XTAL1	XTAL1 oscillator is used for BRG input
TDRV009_BRGSRC_XTAL2	XTAL2 oscillator is used for BRG input
TDRV009_BRGSRC_XTAL3	XTAL3 oscillator is used for BRG input
TDRV009_BRGSRC_RXCEXTERN	External clock at RxC input used for BRG input
TDRV009_BRGSRC_TXCEXTERN	External clock at TxC input used for BRG input

TxCkSource

This parameter specifies the frequency source used as input to the transmit engine. Valid values are:

Value	Description
TDRV009_TXCSRC_BRG	Baud Rate Generator output used for Tx clock
TDRV009_TXCSRC_BRGDIV16	BRG output divided by 16 used for Tx clock
TDRV009_TXCSRC_RXCEXTERN	External clock at RxC input used for Tx clock
TDRV009_TXCSRC_TXCEXTERN	External clock at TxC input used for Tx clock
TDRV009_TXCSRC_DPLL	DPLL output used for Tx clock

TxClockOutput

This parameter specifies which output lines are used to output the transmit clock, e.g. for synchronous communication. The given values can be binary OR'ed. Valid values are:

Value	Description
TDRV009_TXCOUT_TXC	Transmit clock available at TxC output line
TDRV009_TXCOUT_RTS	Transmit clock available at RTS output line

RxClockSource

This parameter specifies the frequency source used as input to the receive engine. Valid values are:

Value	Description
TDRV009_RXCSRC_BRG	Baud Rate Generator output used for Rx clock
TDRV009_RXCSRC_RXCEXTERN	External clock at RxC input used for Rx clock
TDRV009_RXCSRC_DPLL	DPLL output used for Rx clock

ClockMultiplier

This parameter specifies the multiplier used for BRG clock input. Valid values are:

Value	Description
TDRV009_CLKMULT_X1	Clock multiplier disabled
TDRV009_CLKMULT_X4	Selected input clock is multiplied by 4

Baudrate

This parameter specifies the desired frequency to be generated by the Baud Rate Generator (BRG), which can be used as clock input signal. The value is derived from the selected clocksource. Please note that only specific values depending on the selected oscillator are valid. This frequency is internally multiplied by 16, if oversampling shall be used.

ClockInversion

This parameter specifies the inversion of the transmit clock and/or the receive clock. This value can be binary OR'ed. Possible values are:

Value	Description
TDRV009_CLKINV_NONE	no clock inversion
TDRV009_CLKINV_TXC	transmit clock is inverted
TDRV009_CLKINV_RXC	receive clock is inverted

Encoding

This parameter specifies the data encoding used for communication. Valid values are:

Value	Description
TDRV009_ENC_NRZ	NRZ data encoding
TDRV009_ENC_NRZI	NRZI data encoding
TDRV009_ENC_FM0	FM0 data encoding
TDRV009_ENC_FM1	FM1 data encoding
TDRV009_ENC_MANCHESTER	Manchester data encoding

Parity

This parameter specifies the parity bit generation used for asynchronous communication. Valid values are:

Value	Description
TDRV009_PAR_DISABLED	No parity generation is used.
TDRV009_PAR_EVEN	EVEN parity bit
TDRV009_PAR_ODD	ODD parity bit
TDRV009_PAR_SPACE	SPACE parity bit (always insert '0')
TDRV009_PAR_MARK	MARK parity bit (always insert '1')

Stopbits

This parameter specifies the number of stop bits to use for asynchronous communication. Possible values are 1 or 2.

Databits

This parameter specifies the number of data bits to use for asynchronous communication. Possible values are 5 to 8.

UseTermChar

This parameter enables or disables the usage of a termination character for asynchronous communication. Valid values are:

Value	Description
TDRV009_DISABLED	A termination character is not used.
TDRV009_ENABLED	A termination character is used.

TermChar

This parameter specifies the termination character. After receiving this termination character, the communication controller will forward the received data packet immediately to the host system and use a new data packet for further received data. Any 8bit value may be used for this parameter.

HwHs

This parameter enables or disables the hardware handshaking mechanism using RTS/CTS. Valid values are:

Value	Description
TDRV009_DISABLED	Hardware handshaking is not used.
TDRV009_ENABLED	Hardware handshaking is used.

Crc

This parameter is a structure describing the CRC checking configuration.

```
typedef struct
{
    TDRV009_CRC_TYPE           Type;
    TDRV009_ENABLE_DISABLE    RxChecking;
    TDRV009_ENABLE_DISABLE    TxGeneration;
    TDRV009_CRC_RESET         ResetValue;
} TDRV009_CRC;
```

Type

This parameter describes the CRC type to be used. Possible values are:

Value	Description
TDRV009_CRC_16	16bit CRC algorithm is used for checksum
TDRV009_CRC_32	32bit CRC algorithm is used for checksum

RxChecking

This parameter enables or disables the receive CRC checking. Possible values are:

Value	Description
TDRV009_DISABLED	CRC checking will not be used
TDRV009_ENABLED	CRC checking will be used

TxGeneration

This parameter enables or disables the transmit CRC generation. Possible values are:

Value	Description
TDRV009_DISABLED	A CRC checksum will be generated
TDRV009_ENABLED	A CRC checksum will not be generated

ResetValue

This parameter describes the reset value for the CRC algorithm. Possible values are:

Value	Description
TDRV009_CRC_RST_FFFF	CRC reset value will be 0xFFFF
TDRV009_CRC_RST_0000	CRC reset value will be 0x0000

Example

```
#include "tdrv009.h"

TDRV009_DEV                pDev;
int                        retval;
TDRV009_OPERATION_MODE_STRUCT  OperationMode;

/*-----
   Configure channel for Async / RS232 / 115200bps
   -----*/
OperationMode.CommType      = TDRV009_COMMTYPE_ASYNC;
OperationMode.TransceiverMode = TDRV009_TRNSCVR_RS232;
OperationMode.Oversampling  = TDRV009_ENABLED;
OperationMode.BrgSource     = TDRV009_BRGSRC_XTAL1;
OperationMode.TxClkSource   = TDRV009_TXCSRC_BRG;
OperationMode.TxClkOutput   = 0;
OperationMode.RxClkSource   = TDRV009_RXCSRC_BRG;
OperationMode.ClockMultiplier = TDRV009_CLKMULT_X1;
OperationMode.Baudrate      = 115200;
OperationMode.ClockInversion = TDRV009_CLKINV_NONE;
OperationMode.Encoding      = TDRV009_ENC_NRZ;
OperationMode.Parity        = TDRV009_PAR_DISABLED;
OperationMode.Stopbits      = 1;
OperationMode.Databits      = 8;
OperationMode.UseTermChar   = TDRV009_DISABLED;
OperationMode.TermChar      = 0;
OperationMode.HwHs          = TDRV009_DISABLED;
OperationMode.Crc.Type      = TDRV009_CRC_16;
OperationMode.Crc.RxChecking = TDRV009_DISABLED;
OperationMode.Crc.TxGeneration = TDRV009_DISABLED;
OperationMode.Crc.ResetValue = TDRV009_CRC_RST_FFFF;
retval = tdrv009SetOperationMode(pDev, &OperationMode);
if (retval != OK)
{
    /* handle the error */
}

```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid parameter specified. Either the supplied buffer pointer is NULL, or a parameter inside the structure is invalid.

3.2.7 tdrv009GetOperationMode

Name

tdrv009GetOperationMode – Return channel's current operation mode configuration

Synopsis

```
STATUS tdrv009SetOperationMode
(
    TDRV009_DEV                pDev,
    TDRV009_OPERATION_MODE_STRUCT *pOperationMode
)
```

Description

This function returns the channel's current operation mode.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pOperationMode

This argument points to a TDRV009_OPERATION_MODE_STRUCT structure.

```

typedef struct
{
    TDRV009_COMM_TYPE           CommType;
    TDRV009_TRANSCEIVER_MODE    TransceiverMode;
    TDRV009_ENABLE_DISABLE      Oversampling;
    TDRV009_BRGSOURCE           BrgSource;
    TDRV009_TXCSOURCE           TxClkSource;
    unsigned long               TxClkOutput;
    TDRV009_RXCSOURCE           RxClkSource;
    TDRV009_CLKMULTIPLIER       ClockMultiplier;
    unsigned long               Baudrate;
    unsigned char               ClockInversion;
    unsigned char               Encoding;
    TDRV009_PARITY              Parity;
    int                         Stopbits;
    int                         Databits;
    TDRV009_ENABLE_DISABLE      UseTermChar;
    char                        TermChar;
    TDRV009_ENABLE_DISABLE      HwHs;
    TDRV009_CRC                 Crc;
} TDRV009_OPERATION_MODE_STRUCT;

```

CommType

This parameter describes the general communication type for the specific channel. Possible values are:

Value	Description
TDRV009_COMMTYPE_ASYNC	Asynchronous communication
TDRV009_COMMTYPE_HDLC_ADDR0	Standard HDLC communication without address recognition. Used for synchronous communication.
TDRV009_COMMTYPE_HDLC TRANSP	Extended Transparent mode. No protocol processing, channel works as simple bit collector.

TransceiverMode

This parameter describes the transceiver mode of the programmable multi-protocol transceivers. Possible values are:

Value	Description
TDRV009_TRNSCVR_NOT_USED	Default V.11
TDRV009_TRNSCVR_RS530A	EIA-530A (V.11 / V.10)
TDRV009_TRNSCVR_RS530	EIA-530 (V.11), also suitable for RS422
TDRV009_TRNSCVR_X21	X.21 (V.11)
TDRV009_TRNSCVR_V35	V.35 (V.35 / V.28)
TDRV009_TRNSCVR_RS449	EIA-449 (V.11)
TDRV009_TRNSCVR_V36	V.36 (V.11)
TDRV009_TRNSCVR_RS232	EIA-232 (V.28)
TDRV009_TRNSCVR_V28	V.28 (V.28)
TDRV009_TRNSCVR_NO_CABLE	High impedance

Oversampling

This parameter enables or disables 16times oversampling, used for asynchronous communication. For communication with standard UARTs it is recommended to enable this feature. Valid values are:

Value	Description
TDRV009_DISABLED	The 16 times oversampling is not used.
TDRV009_ENABLED	The 16 times oversampling is used.

BrgSource

This parameter specifies the frequency source used as input to the BRG (Baud Rate Generator). Valid values are:

Value	Description
TDRV009_BRGSRC_XTAL1	XTAL1 oscillator is used for BRG input
TDRV009_BRGSRC_XTAL2	XTAL2 oscillator is used for BRG input
TDRV009_BRGSRC_XTAL3	XTAL3 oscillator is used for BRG input
TDRV009_BRGSRC_RXCEXTERN	External clock at RxC input used for BRG input
TDRV009_BRGSRC_TXCEXTERN	External clock at TxC input used for BRG input

TxCkSource

This parameter specifies the frequency source used as input to the transmit engine. Valid values are:

Value	Description
TDRV009_TXCSRC_BRG	Baud Rate Generator output used for Tx clock
TDRV009_TXCSRC_BRGDIV16	BRG output divided by 16 used for Tx clock
TDRV009_TXCSRC_RXCEXTERN	External clock at RxC input used for Tx clock
TDRV009_TXCSRC_TXCEXTERN	External clock at TxC input used for Tx clock
TDRV009_TXCSRC_DPLL	DPLL output used for Tx clock

TxClockOutput

This parameter specifies which output lines are used to output the transmit clock, e.g. for synchronous communication. The given values can be binary OR'ed. Valid values are:

Value	Description
TDRV009_TXCOUT_TXC	Transmit clock available at TxC output line
TDRV009_TXCOUT_RTS	Transmit clock available at RTS output line

RxClockSource

This parameter specifies the frequency source used as input to the receive engine. Valid values are:

Value	Description
TDRV009_RXCSRC_BRG	Baud Rate Generator output used for Rx clock
TDRV009_RXCSRC_RXCEXTERN	External clock at Rx input used for Rx clock
TDRV009_RXCSRC_DPLL	DPLL output used for Rx clock

ClockMultiplier

This parameter specifies the multiplier used for BRG clock input. Valid values are:

Value	Description
TDRV009_CLKMULT_X1	Clock multiplier disabled
TDRV009_CLKMULT_X4	Selected input clock is multiplied by 4

Baudrate

This parameter specifies the desired frequency to be generated by the Baud Rate Generator (BRG), which can be used as clock input signal. The value is derived from the selected clock source. Please note that only specific values depending on the selected oscillator are valid. This frequency is internally multiplied by 16, if oversampling shall be used.

ClockInversion

This parameter specifies the inversion of the transmit clock and/or the receive clock. This value can be binary OR'ed. Possible values are:

Value	Description
TDRV009_CLKINV_NONE	no clock inversion
TDRV009_CLKINV_TXC	transmit clock is inverted
TDRV009_CLKINV_RXC	receive clock is inverted

Encoding

This parameter specifies the data encoding used for communication. Valid values are:

Value	Description
TDRV009_ENC_NRZ	NRZ data encoding
TDRV009_ENC_NRZI	NRZI data encoding
TDRV009_ENC_FM0	FM0 data encoding
TDRV009_ENC_FM1	FM1 data encoding
TDRV009_ENC_MANCHESTER	Manchester data encoding

Parity

This parameter specifies the parity bit generation used for asynchronous communication. Valid values are:

Value	Description
TDRV009_PAR_DISABLED	No parity generation is used.
TDRV009_PAR_EVEN	EVEN parity bit
TDRV009_PAR_ODD	ODD parity bit
TDRV009_PAR_SPACE	SPACE parity bit (always insert '0')
TDRV009_PAR_MARK	MARK parity bit (always insert '1')

Stopbits

This parameter specifies the number of stop bits to use for asynchronous communication. Possible values are 1 or 2.

Databits

This parameter specifies the number of data bits to use for asynchronous communication. Possible values are 5 to 8.

UseTermChar

This parameter enables or disables the usage of a termination character for asynchronous communication. Valid values are:

Value	Description
TDRV009_DISABLED	A termination character is not used.
TDRV009_ENABLED	A termination character is used.

TermChar

This parameter specifies the termination character. After receiving this termination character, the communication controller will forward the received data packet immediately to the host system and use a new data packet for further received data. Any 8bit value may be used for this parameter.

HwHs

This parameter enables or disables the hardware handshaking mechanism using RTS/CTS. Valid values are:

Value	Description
TDRV009_DISABLED	Hardware handshaking is not used.
TDRV009_ENABLED	Hardware handshaking is used.

Crc

This parameter is a structure describing the CRC checking configuration.

```
typedef struct
{
    TDRV009_CRC_TYPE           Type;
    TDRV009_ENABLE_DISABLE    RxChecking;
    TDRV009_ENABLE_DISABLE    TxGeneration;
    TDRV009_CRC_RESET         ResetValue;
} TDRV009_CRC;
```

Type

This parameter describes the CRC type to be used. Possible values are:

Value	Description
TDRV009_CRC_16	16bit CRC algorithm is used for checksum
TDRV009_CRC_32	32bit CRC algorithm is used for checksum

RxChecking

This parameter enables or disables the receive CRC checking. Possible values are:

Value	Description
TDRV009_DISABLED	CRC checking will not be used
TDRV009_ENABLED	CRC checking will be used

TxGeneration

This parameter enables or disables the transmit CRC generation. Possible values are:

Value	Description
TDRV009_DISABLED	A CRC checksum will be generated
TDRV009_ENABLED	A CRC checksum will not be generated

ResetValue

This parameter describes the reset value for the CRC algorithm. Possible values are:

Value	Description
TDRV009_CRC_RST_FFFF	CRC reset value will be 0xFFFF
TDRV009_CRC_RST_0000	CRC reset value will be 0x0000

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;
TDRV009_OPERATION_MODE_STRUCT  OperationMode;

/*-----
   Configure channel for Async / RS232 / 115200bps
   -----*/
OperationMode.CommType          = TDRV009_COMMTYPE_ASYNC;
OperationMode.TransceiverMode   = TDRV009_TRNSCVR_RS232;
OperationMode.Oversampling      = TDRV009_ENABLED;
OperationMode.BrgSource         = TDRV009_BRGSRC_XTAL1;
OperationMode.TxClkSource       = TDRV009_TXCSRC_BRG;
OperationMode.TxClkOutput       = 0;
OperationMode.RxClkSource       = TDRV009_RXCSRC_BRG;
OperationMode.ClockMultiplier  = TDRV009_CLKMULT_X1;
OperationMode.Baudrate          = 115200;
OperationMode.ClockInversion    = TDRV009_CLKINV_NONE;
OperationMode.Encoding          = TDRV009_ENC_NRZ;
OperationMode.Parity            = TDRV009_PAR_DISABLED;
OperationMode.Stopbits         = 1;
OperationMode.Databits          = 8;
OperationMode.UseTermChar       = TDRV009_DISABLED;
OperationMode.TermChar          = 0;
OperationMode.HwHs              = TDRV009_DISABLED;
OperationMode.Crc.Type          = TDRV009_CRC_16;
OperationMode.Crc.RxChecking    = TDRV009_DISABLED;
OperationMode.Crc.TxGeneration  = TDRV009_DISABLED;
OperationMode.Crc.ResetValue    = TDRV009_CRC_RST_FFFF;

retval = tdrv009SetOperationMode(pDev, &OperationMode);
if (retval != OK)
{
    /* handle the error */
}

```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid parameter specified. Either the supplied buffer pointer is NULL, or a parameter inside the structure is invalid.

3.2.8 tdrv009SetBaudrate

Name

tdrv009SetBaudrate – Configure transmission rate

Synopsis

```
STATUS tdrv009SetBaudrate  
(  
    TDRV009_DEV          pDev,  
    int                  Baudrate  
)
```

Description

This function sets up the transmission rate for the specific channel. This is done without changing the configuration set by `tdrv009SetOperationMode`. If async oversampling is enabled, the desired baudrate is internally multiplied by 16. It is important that this result can be derived from the selected clocksource. This function specifies the desired frequency which should be generated by the Baud Rate Generator (BRG).

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

Baudrate

This parameter specifies the baudrate which should be generated by the Baud Rate Generator. Be sure that the baudrate can be derived from the previously selected clock source.

Example

```
#include "tdrv009.h"

TDRV009_DEV      pDev;
int              retval;

/*-----
   Set baudrate to 14400bps
   -----*/
retval = tdrv009SetBaudrate(pDev, 14400);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid parameter specified. The desired baudrate cannot be derived from the selected clock source

3.2.9 tdrv009SetReceiverState

Name

tdrv009SetReceiverState – Enable or disable receiver

Synopsis

```
STATUS tdrv009SetReceiverState
(
    TDRV009_DEV          pDev,
    int                  ReceiverState
)
```

Description

This function sets the channel's receiver either to active or inactive. This function must be called in user-ringbuffer-mode, after a buffer-overflow has happened and free receive buffers are available again.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

ReceiverState

This parameter defines the new state of the receiver. Possible values are:

Value	Description
TDRV009_RCVR_ON	The receiver is enabled.
TDRV009_RCVR_OFF	The receiver is disabled.

Example

```
#include "tdrv009.h"

TDRV009_DEV      pDev;
int              retval;

/*-----
   Enable the receiver
   -----*/
retval = tdrv009SetReceiverState(pDev, TDRV009_RCVR_ON);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid parameter specified.

3.2.10 tdrv009ClearRxBuffer

Name

tdrv009ClearRxBuffer – Discard all received data

Synopsis

```
STATUS tdrv009ClearRxBuffer
(
    TDRV009_DEV          pDev
)
```

Description

This function removes all received data from the channel's receive buffer, and flushes the hardware FIFO as well.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;

/*-----
   Clear receive buffer
   -----*/
retval = tdrv009ClearRxBuffer(pDev);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EIO	Error during reset or init of the receiver's hardware DMA engine.

3.2.11 tdrv009RtsSet

Name

tdrv009RtsSet – Assert RTS signal

Synopsis

```
STATUS tdrv009RtsSet
(
    TDRV009_DEV          pDev
)
```

Description

This function asserts the RTS handshake signal line of the specific channel. This function is not available if the channel is configured for hardware handshaking.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;

/*-----
   Assert RTS
   -----*/
retval = tdrv009RtsSet(pDev);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EPERM	The channel is in hardware handshake mode, so this function is not allowed.

3.2.12 tdrv009RtsClear

Name

tdrv009RtsClear – De-assert RTS signal

Synopsis

```
STATUS tdrv009RtsClear
(
    TDRV009_DEV          pDev
)
```

Description

This function de-asserts the RTS handshake signal line of the specific channel. This function is not available if the channel is configured for hardware handshaking.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;

/*-----
   De-assert RTS
   -----*/
retval = tdrv009RtsClear(pDev);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EPERM	The channel is in hardware handshake mode, so this function is not allowed.

3.2.13 tdrv009CtsGet

Name

tdrv009CtsGet – Return status of CTS signal

Synopsis

```
STATUS tdrv009CtsGet  
(  
    TDRV009_DEV          pDev,  
    unsigned long        *pCtsState  
)
```

Description

This function returns the current state of the CTS handshake signal line of the specific channel.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pCtsState

This parameter points to an unsigned long buffer where the status of the CTS signal will be stored. Depending on the state of CTS, either 0 (inactive) or 1 (active) is returned.

Example

```
#include "tdrv009.h"

TDRV009_DEV      pDev;
int              retval;
unsigned long    CtsStatus;

/*-----
   Read CTS state
   -----*/
retval = tdrv009CtsGet(pDev, &CtsStatus);
if (retval != ERROR)
{
    /* function succeeded */
    printf( "CTS = %ld\n", CtsStatus );
}
else
{
    /* handle the error */
}

```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	The supplied buffer pointer is NULL.

3.2.14 tdrv009DtrSet

Name

tdrv009DtrSet – Assert DTR signal

Synopsis

```
STATUS tdrv009DtrSet
(
    TDRV009_DEV          pDev
)
```

Description

This function sets the DTR signal line to HIGH. This function is only available for the 4th channel of a TDRV009 module.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;

/*-----
   Set DTR to HIGH (only valid for channel 3)
   -----*/
retval = tdrv009DtrSet(pDev);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
ENOTSUP	This function is not supported by the specific channel.

3.2.15 tdrv009DtrClear

Name

tdrv009DtrClear – De-assert DTR signal

Synopsis

```
STATUS tdrv009DtrClear
(
    TDRV009_DEV          pDev
)
```

Description

This function sets the DTR signal line to LOW. This function is only available for the 4th channel of a TDRV009 module.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;

/*-----
   Set DTR to LOW (only valid for channel 3)
   -----*/
retval = tdrv009DtrClear(pDev);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
ENOTSUP	This function is not supported by the specific channel.

3.2.16 tdrv009DsrGet

Name

tdrv009DsrGet – Return status of DSR signal

Synopsis

```
STATUS tdrv009DsrGet  
(  
    TDRV009_DEV          pDev,  
    unsigned long        *pDsrState  
)
```

Description

This function returns the current state of the DSR signal line of the specific channel. This function is only available for the 4th channel of a TDRV009 module

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pDsrState

This parameter points to an unsigned long buffer where the status of the DSR signal will be stored. Depending on the state of DSR, either 0 (inactive) or 1 (active) is returned.

Example

```
#include "tdrv009.h"

TDRV009_DEV      pDev;
int              retval;
unsigned long    DsrStatus;

/*-----
   Read DSR state
   -----*/
retval = tdrv009DsrGet(pDev, &DsrStatus);
if (retval != ERROR)
{
    /* function succeeded */
    printf( "DSR = %ld\n", DsrStatus );
}
else
{
    /* handle the error */
}

```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	The supplied buffer pointer is NULL.

3.2.17 tdrv009SetExternalXtal

Name

tdrv009SetExternalXtal – Configure externally supplied oscillator frequency

Synopsis

```
STATUS tdrv009SetExternalXtal
(
    TDRV009_DEV          pDev,
    int                  XtalFrequency
)
```

Description

This function specifies the frequency of an externally provided clock. This frequency is used for baudrate calculation, and describes the input frequency to the Baud Rate Generator (BRG). The external frequency may be supplied either at input line TxC or RxC.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

XtalFrequency

This parameter specifies the clock frequency in Hz.

Example

```
#include "tdrv009.h"

TDRV009_DEV      pDev;
int              retval;

/*-----
   Specify 1MHz as external clock frequency
   -----*/
retval = tdrv009SetExternalXtal(pDev, 1000000);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid parameter specified. The specified frequency must be larger than 0.

3.2.18 tdrv009RegisterRead

Name

tdrv009RegisterRead – Read from controller’s register space

Synopsis

```
STATUS tdrv009RegisterRead
(
    TDRV009_DEV          pDev,
    TDRV009_ADDR_STRUCT *pRegisterBuffer
)
```

Description

This function reads one 32bit word from the communication controller’s register space.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pRegisterBuffer

This Parameter is a pointer to a *TDRV009_ADDR_STRUCT* structure.

```
typedef struct
{
    unsigned long  Offset;
    unsigned long  Value;
} TDRV009_ADDR_STRUCT;
```

Offset

This parameter specifies a byte offset into the communication controller’s register space. Please refer to the hardware user manual for further information.

Value

This parameter returns the 32bit word from the communication controller’s register space.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;
TDRV009_ADDR_STRUCT AddrBuf;

/*-----
   Read a 32bit value (Version Register)
   -----*/
AddrBuf.Offset = 0x00F0;

retval = tdrv009RegisterRead(pDev, &AddrBuf);
if (retval == OK)
{
    printf( "Value = 0x%lX\n", AddrBuf.Value );
}
else
{
    /* handle the error */
}

```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified. The supplied buffer pointer is NULL.
EACCES	The specified offset is invalid.

3.2.19 tdrv009RegisterWrite

Name

tdrv009RegisterWrite – Write to controller’s register space

Synopsis

```
STATUS tdrv009RegisterWrite
(
    TDRV009_DEV          pDev,
    TDRV009_ADDR_STRUCT *pRegisterBuffer
)
```

Description

This function writes one 32bit word to the communication controller’s register space.

Modifying register contents may result in communication problems, system crash or other unexpected behavior.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pRegisterBuffer

This Parameter is a pointer to a *TDRV009_ADDR_STRUCT* structure.

```
typedef struct
{
    unsigned long  Offset;
    unsigned long  Value;
} TDRV009_ADDR_STRUCT;
```

Offset

This parameter specifies a byte offset into the communication controller’s register space. Please refer to the hardware user manual for further information.

Value

This 32bit word will be written to the communication controller’s register space.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;
TDRV009_ADDR_STRUCT AddrBuf;

/*-----
   Write a 32bit value (FIFO Control Register 4)
   -----*/
AddrBuf.Offset = 0x0034;
AddrBuf.Value  = 0xffffffff;

retval = tdrv009RegisterWrite(pDev, &AddrBuf);
if (retval != OK)
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified. The supplied buffer pointer is NULL.
EACCES	The specified offset is invalid.

3.2.20 tdrv009EepromRead

Name

tdrv009EepromRead – Read from EEPROM

Synopsis

```
STATUS tdrv009EepromRead
(
    TDRV009_DEV          pDev,
    TDRV009_EEPROM_BUFFER *pEepromBuffer
)
```

Description

This function reads one 16bit word from the onboard EEPROM.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pEepromBuffer

This Parameter is a pointer to a *TDRV009_EEPROM_BUFFER* structure.

```
typedef struct
{
    unsigned long  Offset;
    unsigned long  Value;
} TDRV009_EEPROM_BUFFER;
```

Offset

This parameter specifies a 16bit word offset into the EEPROM.
Following offsets are available:

Offset	Access
00h – 5Fh	R
60h – 7Fh	R / W

Value

This parameter returns the 16bit word from the EEPROM at the given offset.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;
TDRV009_EEPROM_BUFFER EepromBuf;

/*-----
   Read a 16bit value into the EEPROM, offset 0
   -----*/
EepromBuf.Offset = 0;

retval = tdrv009EepromRead(pDev, &EepromBuf);
if (retval == OK)
{
    printf( "Value = 0x%lX\n", EepromBuf.Value );
}
else
{
    /* handle the error */
}

```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified. The supplied buffer pointer is NULL.
EACCES	Specified offset is invalid, and may not be accessed.

3.2.21 tdrv009EepromWrite

Name

tdrv009EepromWrite – Write to controller’s register space

Synopsis

```
STATUS tdrv009EepromWrite
(
    TDRV009_DEV          pDev,
    TDRV009_EEPROM_BUFFER *pEepromBuffer
)
```

Description

This function writes one 16bit word into the onboard EEPROM. The first part of the EEPROM is reserved for factory usage, write accesses to this area will result in an error.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pEepromBuffer

This Parameter is a pointer to a *TDRV009_EEPROM_BUFFER* structure.

```
typedef struct
{
    unsigned long  Offset;
    unsigned long  Value;
} TDRV009_EEPROM_BUFFER;
```

Offset

This parameter specifies a 16bit word offset into the EEPROM. Following offsets are available:

Offset	Access
00h – 5Fh	R
60h – 7Fh	R / W

Value

This parameter specifies the 16bit word to be written into the EEPROM at the given offset.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;
TDRV009_EEPROM_BUFFER EepromBuf;

/*-----
   Write a 16bit value into the EEPROM, offset 60h
   -----*/
EepromBuf.Offset = 0x60;
EepromBuf.Value  = 0x1234;

retval = tdrv009EepromWrite(pDev, &EepromBuf);
if (retval != OK)
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified. The supplied buffer pointer is NULL.
EACCES	The specified offset address is invalid, or read-only.

3.2.2 tdrv009RingbufferRegister

Name

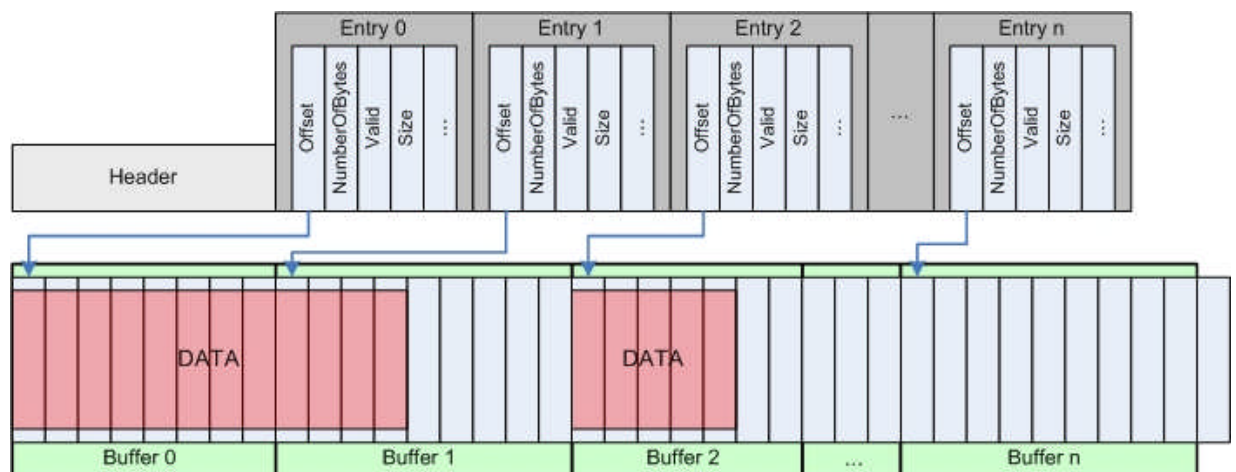

tdrv009RingbufferRegister – Register user-supplied ringbuffer

Synopsis

```
STATUS tdrv009RingbufferRegister
(
    TDRV009_DEV          pDev,
    TDRV009_RINGBUFFER *pRingBuffer
)
```

Description

This advanced function provides a user-supplied ringbuffer to the driver using a pointer to a dynamic TDRV009_RINGBUFFER structure. The buffer consists of a header and a dynamically expandable data section. The driver formats the allocated buffer automatically according to the specification. The user must ensure that the buffer persists as long as it is registered to the driver. The buffer must be physically coherent, because direct memory access is used. Please refer to the following figure for further information.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pRingBuffer

This Parameter is a pointer to a *TDRV009_RINGBUFFER* structure.

```
typedef struct
{
    TDRV009RINGBUFFER_HEADER  Header;
    unsigned char              DataSection[40]; /* dynamically expandable buffer */
} TDRV009_RINGBUFFER;
```

Header

Contains administrative information used for buffer management.

DataSection

Inside the data section the real data buffers and their corresponding entry information is stored.

The *TDRV009_RINGBUFFER_HEADER* structure has the following layout:

```
typedef struct
{
    unsigned long  BufferSize;          /* total size of memory available for data */
    unsigned long  PacketSize;        /* size of one data packet, adjusted by driver */
    unsigned long  NumberOfEntries;    /* number of entries */
    unsigned long  get;                /* index where data can be read */
    unsigned long  put;                /* current index where new data is filled in */
    unsigned long  Overflow;           /* TRUE if an overflow happened. Receiver is disabled. */
} TDRV009_RINGBUFFER_HEADER;
```

BufferSize

Memory size available for the complete data buffers.

PacketSize

Memory size available for one data packet. The complete data buffer is divided into several packets matching the specified *PacketSize*.

NumberOfEntries

Number of available single buffers. This value is calculated out of *BufferSize* and *PacketSize*.
Read Only.

get

Indicates the index where new data can be read out of the ringbuffer.

put

Indicates the index where the driver fills in new arrived data. Read Only.

Overflow

Indicates if a buffer overflow has happened. After a buffer overflow the receiving channel is disabled and must be enabled again by hand. Read Only.

The TDRV009_RINGBUFFER_ENTRY structure has the following layout:

```
typedef struct
{
    unsigned long    NumberOfBytes; /* number of valid bytes for the current buffer index */
    unsigned long    Size;          /* total size of the current buffer */
    unsigned long    Offset;        /* offset into the data section where the buffer starts */
    unsigned long    DmaAddress;    /* physical address for the dma controller */
    unsigned long    Valid;         /* TRUE if the current buffer contains valid data */
} TDRV009_RINGBUFFER_ENTRY;
```

NumberOfBytes

This value indicates the number of valid bytes inside the corresponding buffer. Read Only.

Size

This value indicates the total size of the corresponding data buffer. Read Only.

Offset

This value specifies the offset relative to the beginning of the data section, where the corresponding data buffer starts. Read Only.

DmaAddress

This value states the physical address of the data buffer used by the DMA controller. Read Only.

Valid

This value indicates if the corresponding data buffer contains valid data. This is the only value that should be modified by the user.

To ensure the correct functionality of the ringbuffer mode, do not change any of the administrative read-only information values.

Assistant Macros and Functions for Buffer handling

To help the user work with this ringbuffer concept some assistant macros and functions were defined in “*tdrv009.h*”. They are explained in the following.

`CALCULATE_RINGBUFFER_SIZE(BufferSize, PacketSize)`

calculates the total size necessary for allocation of the complete ringbuffer

`GET_BUFFER(pRingBuffer, index)`

returns a pointer to the corresponding data buffer

`IS_VALID(pRingBuffer, index)`

TRUE if the corresponding buffer contains valid data, otherwise FALSE

`SET_VALID(pRingBuffer, index, value)`

sets the Valid-flag for the specified entry to *value*

`CLEAR_BUFFER(pRingBuffer, index)`

clears the corresponding data buffer

`GET_POS(pRingBuffer)`

returns the current get-position where new data can be read

`OVERFLOW(pRingBuffer)`

TRUE if a buffer overflow has happened, otherwise false

`unsigned char*`

`GetNewBuffer(TP862_RINGBUFFER* pRingBuffer, ULONG* length);`

returns a pointer to a buffer containing new data. The *get*-position is set to the next entry, the number of valid bytes is returned in *length*. The previous data buffer is marked as invalid, so the driver may reuse this buffer for data reception.

For further information on how to deal with the ringbuffer, the special assistant macros, and functions, please refer to the provided example application.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;
TDRV009_RINGBUFFER* pRingBuffer;

#define BUFFER_SIZE    5000
#define PACKET_SIZE    100

/*-----
   allocate memory for ringbuffer (physically coherent, nonchached):
   5000 bytes total data space
   100 bytes per packet
   -----*/
pRingBuffer = (TDRV009_RINGBUFFER*)cacheDmaMalloc(
                CALCULATE_RINGBUFFER_SIZE( BUFFER_SIZE, PACKET_SIZE )
                );
pRingBuffer->Header.BufferSize = BUFFER_SIZE;
pRingBuffer->Header.PacketSize = PACKET_SIZE;

retval = tdrv009RingbufferRegister(pDev, pRingBuffer);
if (retval != OK)
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified. The supplied buffer pointer is NULL.
EBUSY	A ringbuffer is already registered. Unregister it first.
ENOMEM	Not enough memory available to create necessary receive descriptor list.
EIO	Error during reset or init of the receiver's hardware DMA engine.

3.2.23 tdrv009RingbufferUnregister

Name

tdrv009RingbufferUnregister – Unregister user-supplied ringbuffer

Synopsis

```
STATUS tdrv009RingbufferUnregister
(
    TDRV009_DEV          pDev
)
```

Description

This function unregisters a previously registered user-ringbuffer. A channel-reset is performed and the driver uses its internal ringbuffer to receive data again.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;

/*-----
   unregister user-supplied ringbuffer
   -----*/
retval = tdrv009RingbufferUnregister(pDev);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EACCES	No user-supplied ringbuffer is used, so this function is not supported at the moment.
EIO	Error during reset or init of the receiver's hardware DMA engine.

3.2.24 tdrv009WaitForInterrupt

Name

tdrv009WaitForInterrupt – Wait for SCC interrupt event

Synopsis

```
STATUS tdrv009WaitForInterrupt  
(  
    TDRV009_DEV          pDev,  
    TDRV009_WAIT_STRUCT *pWaitBuffer  
)
```

Description

This function waits until a specified SCC-interrupt or the timeout occurs.

Parameters

pDev

This parameter specifies the device descriptor to the hardware module retrieved by a call to the corresponding open-function.

pEepromBuffer

This parameter is a pointer to a *TDRV009_WAIT_STRUCT* structure.

```
typedef struct  
{  
    unsigned long  Interrupts;  
    int            Timeout;  
} TDRV009_WAIT_STRUCT;
```

Interrupts

This parameter specifies interrupt bits to wait for. If at least one interrupt occurs, the value is returned in this parameter. Please refer to the hardware user manual for further information on the possible SCC interrupt bits.

Timeout

This parameter specifies the time (in system ticks) to wait for an interrupt. If -1 is specified, the function will block indefinitely.

Example

```
#include "tdrv009.h"

TDRV009_DEV          pDev;
int                  retval;
TDRV009_WAIT_STRUCT WaitStruct;

/*-----
   Wait at least 60 system ticks for a
   CTS Status Change (CSC) interrupt
   -----*/
WaitStruct.Interrupts = (1 << 14);
WaitStruct.Timeout    = 60;

retval = tdrv009WaitForInterrupt(pDev, &WaitStruct);
if(retval == OK)
{
    printf( "Occurred Interrupt = 0x%lX\n", WaitStruct.Interrupts );
}
else
{
    /* handle the error */
}

```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EBADF	The device handle is invalid
EINVAL	Invalid data buffer specified. The supplied buffer pointer is NULL.
EBUSY	Too many simultaneous wait jobs active.
S_objLib_OBJ_TIMEOUT	Timeout occurred.

4 Legacy I/O system functions

This chapter describes the driver-level interface to the I/O system. The purpose of these functions is to install the driver in the I/O system, add and initialize devices.

4.1 tdrv009Drv()

NAME

tdrv009Drv() - installs the TDRV009 driver in the I/O system

SYNOPSIS

```
#include "tdrv009.h"
```

```
STATUS tdrv009Drv(void)
```

DESCRIPTION

This function searches for devices on the PCI bus, and installs the TDRV009 driver in the I/O system.

A call to this function is the first thing the user has to do before adding any device to the system or performing any I/O request.

EXAMPLE

```
#include "tdrv009.h"

STATUS          result;

/*-----
   Initialize Driver
   -----*/
result = tdrv009Drv();
if (result == ERROR)
{
    /* Error handling */
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error codes are stored in *errno* and can be read with the function *errnoGet()*.

Error code	Description
ENOMEM	Not enough memory available.
ENXIO	No supported modules found.
EIO	Error during hardware configuration.

4.2 tdrv009DevCreate()

NAME

tdrv009DevCreate() – Add a TDRV009 device to the VxWorks system

SYNOPSIS

```
#include "tdrv009.h"
```

```
STATUS tdrv009DevCreate
(
    char      *name,
    int       devIdx,
    int       funcType,
    void      *pParam
)
```

DESCRIPTION

This routine adds the selected device to the VxWorks system. The device hardware will be setup and prepared for use.

This function must be called before performing any I/O request to this device.

PARAMETER

name

This string specifies the name of the device that will be used to identify the device, for example for *open()* calls.

devIdx

This index number specifies the device to add to the system.

The index number depends on the search priority of the modules. The modules will be searched in the following order:

- TPMC863-xx
- TPMC363-xx
- TCP863-xx
- TAMC863-xx

If modules of the same type are installed the channel numbers will be assigned in the order the VxWorks *pciFindDevice()* function will find the devices.

Example: (A system with 1 TPMC863-xx, 2 TPMC363-xx, and 1 TCP863-xx) will assign the following device indices:

Module	Device Index
TPMC863-xx	0
TPMC363-xx (1 st)	1
TPMC363-xx (2 nd)	2
TCP863-xx	3

funcType

This parameter is unused and should be set to 0.

pParam

This parameter is unused and should be set to *NULL*.

EXAMPLE

```
#include "tdrv009.h"

STATUS          result;

/*-----
   Create the device "/tdrv009/0" for the first channel device
   -----*/
result = tdrv009DevCreate(  "/tdrv009/0",
                           0,
                           0,
                           (void*)NULL);

if (result == OK)
{
    /* Device successfully created */
}
else
{
    /* Error occurred when creating the device */
}
}
```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error codes are stored in *errno* and can be read with the function *errnoGet()*.

Error code	Description
ENXIO	No supported modules found.
EBUSY	The desired device has already been created.

VxWorks Programmer's Guide: I/O System

4.3 tdrv009Pcilnit()

NAME

tdrv009Pcilnit() – Generic PCI device initialization

SYNOPSIS

```
void tdrv009Pcilnit()
```

DESCRIPTION

This function is required only for Intel x86 VxWorks platforms. The purpose is to setup the MMU mapping for all required TDRV009 PCI spaces (base address register) and to enable the TDRV009 device for access.

The global variable *tdrv009Status* obtains the result of the device initialization and can be polled later by the application before the driver will be installed.

Value	Meaning
> 0	Initialization successful completed. The value of tdrv009Status is equal to the number of mapped PCI spaces
0	No TDRV009 device found
< 0	Initialization failed. The value of (tdrv009Status & 0xFF) is equal to the number of mapped spaces until the error occurs. Possible cause: Too few entries for dynamic mappings in sysPhysMemDesc[]. Remedy: Add dummy entries as necessary (syslib.c).

EXAMPLE

```
extern void tdrv009PciInit();
```

...

```
tdrv009PciInit();
```

5 I/O Functions

5.1 open()

NAME

open() - open a device or file.

SYNOPSIS

```
int open
(
    const char *name,
    int        flags,
    int        mode
)
```

DESCRIPTION

Before I/O can be performed to the TDRV009 device, a file descriptor must be opened by invoking the basic I/O function *open()*.

PARAMETER

name

Specifies the device which shall be opened, the name specified in *tdrv009DevCreate()* must be used

flags

Not used

mode

Not used

EXAMPLE

```
int      fd;

/*-----
   Open the device named "/tdrv009/0" for I/O
   -----*/
fd = open("/tdrv009/0", 0, 0);
if (fd == ERROR)
{
    /* Handle error */
}
```

RETURNS

A device descriptor number or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual).

SEE ALSO

ioLib, basic I/O routine - *open()*

5.2 close()

NAME

close() – close a device or file

SYNOPSIS

```
STATUS close
(
    int      fd
)
```

DESCRIPTION

This function closes opened devices.

PARAMETER

fd

This file descriptor specifies the device to be closed. The file descriptor has been returned by the *open()* function.

EXAMPLE

```
int      fd;
STATUS   retval;

/*-----
   close the device
   -----*/
retval = close(fd);
if (retval == ERROR)
{
    /* Handle error */
}
```

RETURNS

OK or ERROR. If the function fails, an error code will be stored in *errno*.

ERROR CODES

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual).

SEE ALSO

ioLib, basic I/O routine - close()

5.3 read()

NAME

read() – read data from a specified device.

SYNOPSIS

```
int read
(
    int      fd,
    char     *buffer,
    size_t   maxbytes
)
```

DESCRIPTION

This function can be used to read data from the device.

PARAMETER

fd

This file descriptor specifies the device to be used. The file descriptor has been returned by the *open()* function.

buffer

This argument points to a user supplied buffer. The returned data will be filled into this buffer.

maxbytes

This parameter specifies the maximum number of read bytes (buffer size).

EXAMPLE

```
#define  BUFSIZE  100

int      fd;
char     buffer[BUFSIZE];
int      retval;

/*-----
   Read data from TDRV009 device
   -----*/
retval = read(fd, buffer, BUFSIZE);
if (retval != ERROR)
{
    printf("%d bytes read\n", retval);
}
else
{
    /* handle the read error */
}
```

RETURNS

Number of bytes read or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set error code described below.

Error code	Description
EACCES	An external ringbuffer is in use, so this function is not supported at the moment.

SEE ALSO

ioLib, basic I/O routine - read()

5.4 write()

NAME

write() – write data from a buffer to a specified device.

SYNOPSIS

```
int write
(
    int          fd,
    char         *buffer,
    size_t       nbytes
)
```

DESCRIPTION

This function can be used to write data to the device. The function returns immediately to the caller after queuing the data into the transmit descriptor list. Make sure that the supplied data buffer persists until the transmission is completed. To check if the data buffer is completely processed, namely the data has been transferred to the hardware FIFO, use the I/O control function TDRV009_WRITEBUF_DONE (see below).

PARAMETER

fd

This file descriptor specifies the device to be used. The file descriptor has been returned by the *open()* function.

buffer

This argument points to a user supplied buffer. The data of the buffer will be written to the device. The data buffer must be physically contiguous and accessible by the DMA controller

nbytes

This parameter specifies the number of bytes to be written.

EXAMPLE

```

int          fd;
char        *buffer;
int         retval;

/*-----
   Write data to a TDRV009 device
   -----*/
pData = (char*)cacheDmaMalloc( 12 );
sprintf( pData, "Hello World" );

retval = write(fd, buffer, strlen(buffer));
if (retval == OK)
{
    printf("Data queued for transmission.\n");
}
else
{
    /* handle the write error */
}

```

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual) or a driver set code described below.

Error code	Description
EBUSY	A different write operation is currently in progress.
ENOMEM	No transmit packets or descriptors available. Too many parallel transmissions in progress.
EIO	Error during channel initialization.

SEE ALSO

ioLib, basic I/O routine - write()

5.5 ioctl()

NAME

ioctl() - performs an I/O control function.

SYNOPSIS

```
#include "tdrv009.h"
```

```
int ioctl
(
    int    fd,
    int    request,
    int    arg
)
```

DESCRIPTION

Special I/O operation that do not fit to the standard basic I/O calls (read, write) will be performed by calling the ioctl() function.

PARAMETER

fd

This file descriptor specifies the device to be used. The file descriptor has been returned by the *open()* function.

request

This argument specifies the function that shall be executed. Following functions are defined:

Function	Description
TDRV009_SET_OPERATION_MODE	Configure channel operation mode
TDRV009_GET_OPERATION_MODE	Read current channel configuration
TDRV009_SET_BPS	Setup transmission rate
TDRV009_FRAME_READ	Read data buffer
TDRV009_FRAME_WRITE	Write data buffer
TDRV009_WRITEBUF_DONE	Check status of transmit data buffer
TDRV009_RINGBUFFER_REGISTER	Register user ringbuffer
TDRV009_RINGBUFFER_UNREGISTER	Unregister user ringbuffer
TDRV009_SET_RECEIVER_STATE	Configure receiver state
TDRV009_CLEAR_RX_BUFFER	Clear receive buffer and FIFO
TDRV009_EEPROM_WRITE	Write value to EEPROM
TDRV009_EEPROM_READ	Read value from EEPROM
TDRV009_RTS_SET	Assert RTS handshake line

TDRV009_RTS_CLEAR	De-Assert RTS handshake line
TDRV009_CTS_GET	Read state of CTS
TDRV009_DTR_SET	Set DTR signal line
TDRV009_DTR_CLEAR	Clear DTR signal line
TDRV009_DSR_GET	Read state of DSR
TDRV009_SET_EXT_XTAL	Configure externally supplied clock frequency
TDRV009_REGREAD	Read value from register space
TDRV009_REGWRITE	Write value to register space
TDRV009_WAITFORINTERRUPT	Wait for specific SCC interrupt

arg

This parameter depends on the selected function (request). How to use this parameter is described below with the function.

RETURNS

OK or ERROR. If the function fails an error code will be stored in *errno*.

ERROR CODES

The error code can be read with the function *errnoGet()*.

The error code is a standard error code set by the I/O system (see VxWorks Reference Manual). Function specific error codes will be described with the function.

Error code	Description
ENOTSUP	Command not supported by device driver or module.

SEE ALSO

ioLib, basic I/O routine - *ioctl()*

5.5.1 TDRV009_SET_OPERATION_MODE

This I/O control function configures the channel's operation mode. The function specific control parameter **arg** is a pointer to a *TDRV009_OPERATION_MODE_STRUCT* structure. It is necessary to completely initialize the structure. This can be done by calling the I/O control function *TDRV009_GET_OPERATION_MODE* described below.

A call to this function must be done prior to any communication operation, because after driver startup, the channel's transceivers are disabled.

```
typedef struct
{
    TDRV009_COMM_TYPE           CommType;
    TDRV009_TRANSCEIVER_MODE   TransceiverMode;
    TDRV009_ENABLE_DISABLE     Oversampling;
    TDRV009_BRGSOURCE          BrgSource;
    TDRV009_TXCSOURCE          TxClkSource;
    unsigned long              TxClkOutput;
    TDRV009_RXCSOURCE          RxClkSource;
    TDRV009_CLKMULTIPLIER      ClockMultiplier;
    unsigned long              Baudrate;
    unsigned char              ClockInversion;
    unsigned char              Encoding;
    TDRV009_PARITY             Parity;
    int                        Stopbits;
    int                        Databits;
    TDRV009_ENABLE_DISABLE     UseTermChar;
    char                       TermChar;
    TDRV009_ENABLE_DISABLE     HwHs;
    TDRV009_CRC                Crc;
} TDRV009_OPERATION_MODE_STRUCT;
```

CommType

This parameter describes the general communication type for the specific channel. Possible values are:

Value	Description
TDRV009_COMMTYPE_ASYNC	Asynchronous communication
TDRV009_COMMTYPE_HDLC_ADDR0	Standard HDLC communication without address recognition. Used for synchronous communication.
TDRV009_COMMTYPE_HDLC TRANSP	Extended Transparent mode. No protocol processing, channel works as simple bit collector.

TransceiverMode

This parameter describes the transceiver mode of the programmable multi-protocol transceivers. Possible values are:

Value	Description
TDRV009_TRNSCVR_NOT_USED	Default V.11
TDRV009_TRNSCVR_RS530A	EIA-530A (V.11 / V.10)
TDRV009_TRNSCVR_RS530	EIA-530 (V.11), also suitable for RS422
TDRV009_TRNSCVR_X21	X.21 (V.11)
TDRV009_TRNSCVR_V35	V.35 (V.35 / V.28)
TDRV009_TRNSCVR_RS449	EIA-449 (V.11)
TDRV009_TRNSCVR_V36	V.36 (V.11)
TDRV009_TRNSCVR_RS232	EIA-232 (V.28)
TDRV009_TRNSCVR_V28	V.28 (V.28)
TDRV009_TRNSCVR_NO_CABLE	High impedance

Oversampling

This parameter enables or disables 16 times oversampling, used for asynchronous communication. For communication with standard UARTs it is recommended to enable this feature. Valid values are:

Value	Description
TDRV009_DISABLED	The 16 times oversampling is not used.
TDRV009_ENABLED	The 16 times oversampling is used.

BrgSource

This parameter specifies the frequency source used as input to the BRG (Baud Rate Generator). Valid values are:

Value	Description
TDRV009_BRGSRC_XTAL1	XTAL1 oscillator is used for BRG input
TDRV009_BRGSRC_XTAL2	XTAL2 oscillator is used for BRG input
TDRV009_BRGSRC_XTAL3	XTAL3 oscillator is used for BRG input
TDRV009_BRGSRC_RXCEXTERN	External clock at RxC input used for BRG input
TDRV009_BRGSRC_TXCEXTERN	External clock at TxC input used for BRG input

TxCkSource

This parameter specifies the frequency source used as input to the transmit engine. Valid values are:

Value	Description
TDRV009_TXCSRC_BRG	Baud Rate Generator output used for Tx clock
TDRV009_TXCSRC_BRGDIV16	BRG output divided by 16 used for Tx clock
TDRV009_TXCSRC_RXCEXTERN	External clock at RxC input used for Tx clock
TDRV009_TXCSRC_TXCEXTERN	External clock at TxC input used for Tx clock
TDRV009_TXCSRC_DPLL	DPLL output used for Tx clock

TxClockOutput

This parameter specifies which output lines are used to output the transmit clock, e.g. for synchronous communication. The given values can be binary OR'ed. Valid values are:

Value	Description
TDRV009_TXCOUT_TXC	Transmit clock available at TxC output line
TDRV009_TXCOUT_RTS	Transmit clock available at RTS output line

RxClockSource

This parameter specifies the frequency source used as input to the receive engine. Valid values are:

Value	Description
TDRV009_RXCSRC_BRG	Baud Rate Generator output used for Rx clock
TDRV009_RXCSRC_RXCEXTERN	External clock at RxC input used for Rx clock
TDRV009_RXCSRC_DPLL	DPLL output used for Rx clock

ClockMultiplier

This parameter specifies the multiplier used for BRG clock input. Valid values are:

Value	Description
TDRV009_CLKMULT_X1	Clock multiplier disabled
TDRV009_CLKMULT_X4	Selected input clock is multiplied by 4

Baudrate

This parameter specifies the desired frequency to be generated by the Baud Rate Generator (BRG), which can be used as clock input signal. The value is derived from the selected clock source. Please note that only specific values depending on the selected oscillator are valid. This frequency is internally multiplied by 16, if oversampling shall be used.

ClockInversion

This parameter specifies the inversion of the transmit clock and/or the receive clock. This value can be binary OR'ed. Possible values are:

Value	Description
TDRV009_CLKINV_NONE	no clock inversion
TDRV009_CLKINV_TXC	transmit clock is inverted
TDRV009_CLKINV_RXC	receive clock is inverted

Encoding

This parameter specifies the data encoding used for communication. Valid values are:

Value	Description
TDRV009_ENC_NRZ	NRZ data encoding
TDRV009_ENC_NRZI	NRZI data encoding
TDRV009_ENC_FM0	FM0 data encoding
TDRV009_ENC_FM1	FM1 data encoding
TDRV009_ENC_MANCHESTER	Manchester data encoding

Parity

This parameter specifies the parity bit generation used for asynchronous communication. Valid values are:

Value	Description
TDRV009_PAR_DISABLED	No parity generation is used.
TDRV009_PAR_EVEN	EVEN parity bit
TDRV009_PAR_ODD	ODD parity bit
TDRV009_PAR_SPACE	SPACE parity bit (always insert '0')
TDRV009_PAR_MARK	MARK parity bit (always insert '1')

Stopbits

This parameter specifies the number of stop bits to use for asynchronous communication. Possible values are 1 or 2.

Databits

This parameter specifies the number of data bits to use for asynchronous communication. Possible values are 5 to 8.

UseTermChar

This parameter enables or disables the usage of a termination character for asynchronous communication. Valid values are:

Value	Description
TDRV009_DISABLED	A termination character is not used.
TDRV009_ENABLED	A termination character is used.

TermChar

This parameter specifies the termination character. After receiving this termination character, the communication controller will forward the received data packet immediately to the host system and use a new data packet for further received data. Any 8bit value may be used for this parameter.

HwHs

This parameter enables or disables the hardware handshaking mechanism using RTS/CTS. Valid values are:

Value	Description
TDRV009_DISABLED	Hardware handshaking is not used.
TDRV009_ENABLED	Hardware handshaking is used.

Crc

This parameter is a structure describing the CRC checking configuration.

```
typedef struct
{
    TDRV009_CRC_TYPE           Type;
    TDRV009_ENABLE_DISABLE    RxChecking;
    TDRV009_ENABLE_DISABLE    TxGeneration;
    TDRV009_CRC_RESET         ResetValue;
} TDRV009_CRC;
```

Type

This parameter describes the CRC type to be used. Possible values are:

Value	Description
TDRV009_CRC_16	16bit CRC algorithm is used for checksum
TDRV009_CRC_32	32bit CRC algorithm is used for checksum

RxChecking

This parameter enables or disables the receive CRC checking. Possible values are:

Value	Description
TDRV009_DISABLED	CRC checking will not be used
TDRV009_ENABLED	CRC checking will be used

TxGeneration

This parameter enables or disables the transmit CRC generation. Possible values are:

Value	Description
TDRV009_DISABLED	A CRC checksum will be generated
TDRV009_ENABLED	A CRC checksum will not be generated

ResetValue

This parameter describes the reset value for the CRC algorithm. Possible values are:

Value	Description
TDRV009_CRC_RST_FFFF	CRC reset value will be 0xFFFF
TDRV009_CRC_RST_0000	CRC reset value will be 0x0000

EXAMPLE

```

#include "tdrv009.h"

int          fd;
TDRV009_OPERATION_MODE_STRUCT  OperationMode;
int          retval;

/*-----
   Configure channel for Async / RS232 / 115200bps
   -----*/
OperationMode.CommType          = TDRV009_COMMTYPE_ASYNC;
OperationMode.TransceiverMode   = TDRV009_TRNSCVR_RS232;
OperationMode.Oversampling      = TDRV009_ENABLED;
OperationMode.BrgSource         = TDRV009_BRGSRC_XTAL1;
OperationMode.TxClockSource     = TDRV009_TXCSRC_BRG;
OperationMode.TxClockOutput     = 0;
OperationMode.RxClockSource     = TDRV009_RXCSRC_BRG;
OperationMode.ClockMultiplier  = TDRV009_CLKMULT_X1;
OperationMode.Baudrate          = 115200;
OperationMode.ClockInversion    = TDRV009_CLKINV_NONE;
OperationMode.Encoding          = TDRV009_ENC_NRZ;
OperationMode.Parity            = TDRV009_PAR_DISABLED;
OperationMode.Stopbits          = 1;
OperationMode.Databits          = 8;
OperationMode.UseTermChar       = TDRV009_DISABLED;
OperationMode.TermChar          = 0;
OperationMode.HwHs              = TDRV009_DISABLED;
OperationMode.Crc.Type          = TDRV009_CRC_16;
OperationMode.Crc.RxChecking    = TDRV009_DISABLED;
OperationMode.Crc.TxGeneration  = TDRV009_DISABLED;
OperationMode.Crc.ResetValue    = TDRV009_CRC_RST_FFFF;

retval = ioctl(fd, TDRV009_SET_OPERATION_MODE, (int)&OperationMode);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}

```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. Either the supplied buffer pointer is NULL, or a parameter inside the structure is invalid.

5.5.2 TDRV009_GET_OPERATION_MODE

This I/O control function returns the channel's current operation mode. The function specific control parameter **arg** is a pointer to a *TDRV009_OPERATION_MODE_STRUCT* structure.

```
typedef struct
{
    TDRV009_COMM_TYPE           CommType;
    TDRV009_TRANSCEIVER_MODE   TransceiverMode;
    TDRV009_ENABLE_DISABLE     Oversampling;
    TDRV009_BRGSOURCE          BrgSource;
    TDRV009_TXCSOURCE          TxClkSource;
    unsigned long              TxClkOutput;
    TDRV009_RXCSOURCE          RxClkSource;
    TDRV009_CLKMULTIPLIER      ClockMultiplier;
    unsigned long              Baudrate;
    unsigned char              ClockInversion;
    unsigned char              Encoding;
    TDRV009_PARITY             Parity;
    int                        Stopbits;
    int                        Databits;
    TDRV009_ENABLE_DISABLE     UseTermChar;
    char                       TermChar;
    TDRV009_ENABLE_DISABLE     HwHs;
    TDRV009_CRC                Crc;
} TDRV009_OPERATION_MODE_STRUCT;
```

CommType

This parameter describes the general communication type for the specific channel. Possible values are:

Value	Description
TDRV009_COMMTYPE_ASYNC	Asynchronous communication
TDRV009_COMMTYPE_HDLC_ADDR0	Standard HDLC communication without address recognition. Used for synchronous communication.
TDRV009_COMMTYPE_HDLC TRANSP	Extended Transparent mode. No protocol processing, channel works as simple bit collector.

TransceiverMode

This parameter describes the transceiver mode of the programmable multi-protocol transceivers. Possible values are:

Value	Description
TDRV009_TRNSCVR_NOT_USED	Default V.11
TDRV009_TRNSCVR_RS530A	EIA-530A (V.11 / V.10)
TDRV009_TRNSCVR_RS530	EIA-530 (V.11), also suitable for RS422
TDRV009_TRNSCVR_X21	X.21 (V.11)
TDRV009_TRNSCVR_V35	V.35 (V.35 / V.28)
TDRV009_TRNSCVR_RS449	EIA-449 (V.11)
TDRV009_TRNSCVR_V36	V.36 (V.11)
TDRV009_TRNSCVR_RS232	EIA-232 (V.28)
TDRV009_TRNSCVR_V28	V.28 (V.28)
TDRV009_TRNSCVR_NO_CABLE	High impedance

Oversampling

This parameter enables or disables 16 times oversampling, used for asynchronous communication. For communication with standard UARTs it is recommended to enable this feature. Valid values are:

Value	Description
TDRV009_DISABLED	The 16 times oversampling is not used.
TDRV009_ENABLED	The 16 times oversampling is used.

BrgSource

This parameter specifies the frequency source used as input to the BRG (Baud Rate Generator). Valid values are:

Value	Description
TDRV009_BRGSRC_XTAL1	XTAL1 oscillator is used for BRG input
TDRV009_BRGSRC_XTAL2	XTAL2 oscillator is used for BRG input
TDRV009_BRGSRC_XTAL3	XTAL3 oscillator is used for BRG input
TDRV009_BRGSRC_RXCEXTERN	External clock at RxC input used for BRG input
TDRV009_BRGSRC_TXCEXTERN	External clock at TxC input used for BRG input

TxCclkSource

This parameter specifies the frequency source used as input to the transmit engine. Valid values are:

Value	Description
TDRV009_TXCSRC_BRG	Baud Rate Generator output used for Tx clock
TDRV009_TXCSRC_BRGDIV16	BRG output divided by 16 used for Tx clock
TDRV009_TXCSRC_RXCEXTERN	External clock at RxC input used for Tx clock
TDRV009_TXCSRC_TXCEXTERN	External clock at TxC input used for Tx clock
TDRV009_TXCSRC_DPLL	DPLL output used for Tx clock

TxClockOutput

This parameter specifies which output lines are used to output the transmit clock, e.g. for synchronous communication. The given values can be binary OR'ed. Valid values are:

Value	Description
TDRV009_TXCOUT_TXC	Transmit clock available at TxC output line
TDRV009_TXCOUT_RTS	Transmit clock available at RTS output line

RxClockSource

This parameter specifies the frequency source used as input to the receive engine. Valid values are:

Value	Description
TDRV009_RXCSRC_BRG	Baud Rate Generator output used for Rx clock
TDRV009_RXCSRC_RXCEXTERN	External clock at RxC input used for Rx clock
TDRV009_RXCSRC_DPLL	DPLL output used for Rx clock

ClockMultiplier

This parameter specifies the multiplier used for BRG clock input. Valid values are:

Value	Description
TDRV009_CLKMULT_X1	Clock multiplier disabled
TDRV009_CLKMULT_X4	Selected input clock is multiplied by 4

Baudrate

This parameter specifies the desired frequency to be generated by the BRG (Baud Rate Generator), which can be used as clock input signal. The value is derived from the selected clock source. Please note that only specific values depending on the selected oscillator are valid. This frequency is internally multiplied by 16, if oversampling shall be used.

ClockInversion

This parameter specifies the inversion of the transmit clock and/or the receive clock. This value can be binary OR'ed. Possible values are:

Value	Description
TDRV009_CLKINV_NONE	no clock inversion
TDRV009_CLKINV_TXC	transmit clock is inverted
TDRV009_CLKINV_RXC	receive clock is inverted

Encoding

This parameter specifies the data encoding used for communication. Valid values are:

Value	Description
TDRV009_ENC_NRZ	NRZ data encoding
TDRV009_ENC_NRZI	NRZI data encoding
TDRV009_ENC_FM0	FM0 data encoding
TDRV009_ENC_FM1	FM1 data encoding
TDRV009_ENC_MANCHESTER	Manchester data encoding

Parity

This parameter specifies the parity bit generation used for asynchronous communication. Valid values are:

Value	Description
TDRV009_PAR_DISABLED	No parity generation is used.
TDRV009_PAR_EVEN	EVEN parity bit
TDRV009_PAR_ODD	ODD parity bit
TDRV009_PAR_SPACE	SPACE parity bit (always insert '0')
TDRV009_PAR_MARK	MARK parity bit (always insert '1')

Stopbits

This parameter specifies the number of stop bits to use for asynchronous communication. Possible values are 1 or 2.

Databits

This parameter specifies the number of data bits to use for asynchronous communication. Possible values are 5 to 8.

UseTermChar

This parameter enables or disables the usage of a termination character for asynchronous communication. Valid values are:

Value	Description
TDRV009_DISABLED	A termination character is not used.
TDRV009_ENABLED	A termination character is used.

TermChar

This parameter specifies the termination character. After receiving this termination character, the communication controller will forward the received data packet immediately to the host system and use a new data packet for further received data. Any 8bit value may be used for this parameter.

HwHs

This parameter enables or disables the hardware handshaking mechanism using RTS/CTS. Valid values are:

Value	Description
TDRV009_DISABLED	Hardware handshaking is not used.
TDRV009_ENABLED	Hardware handshaking is used.

Crc

This parameter is a structure describing the CRC checking configuration.

```
typedef struct
{
    TDRV009_CRC_TYPE           Type;
    TDRV009_ENABLE_DISABLE    RxChecking;
    TDRV009_ENABLE_DISABLE    TxGeneration;
    TDRV009_CRC_RESET         ResetValue;
} TDRV009_CRC;
```

Type

This parameter describes the CRC type to be used. Possible values are:

Value	Description
TDRV009_CRC_16	16bit CRC algorithm is used for checksum
TDRV009_CRC_32	32bit CRC algorithm is used for checksum

RxChecking

This parameter enables or disables the receive CRC checking. Possible values are:

Value	Description
TDRV009_DISABLED	CRC checking will not be used
TDRV009_ENABLED	CRC checking will be used

TxGeneration

This parameter enables or disables the transmit CRC generation. Possible values are:

Value	Description
TDRV009_DISABLED	A CRC checksum will be generated
TDRV009_ENABLED	A CRC checksum will not be generated

ResetValue

This parameter describes the reset value for the CRC algorithm. Possible values are:

Value	Description
TDRV009_CRC_RST_FFFF	CRC reset value will be 0xFFFF
TDRV009_CRC_RST_0000	CRC reset value will be 0x0000

EXAMPLE

```
#include "tdrv009.h"

int                fd;
TDRV009_OPERATION_MODE_STRUCT  OperationMode;
int                retval;

/*-----
   Retrieve current configuration
   -----*/
retval = ioctl(fd, TDRV009_GET_OPERATION_MODE, (int)&OperationMode);
if (retval != ERROR)
{
    /* function succeeded */
    printf( "Current speed: %d bps\n", OperationMode.Baudrate );
}
else
{
    /* handle the error */
}
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.

5.5.3 TDRV009_SET_BPS

This I/O control function sets up the transmission rate for the specific channel. This is done without all the other configuration stuff contained in TDRV009_SET_OPERATION_MODE. If async oversampling is enabled, the desired baudrate is internally multiplied by 16. It is important that this result can be derived from the selected clocksource. This function specifies the desired frequency which should be generated by the Baud Rate Generator (BRG). The function dependent parameter **arg** passes an *unsigned long* value containing the desired baudrate to the device driver.

EXAMPLE

```
#include "tdrv009.h"

...

int          fd;
unsigned long Baudrate;
int          retval;

...

/*-----
   Set baudrate to 14400bps
   -----*/
Baudrate = 14400;
retval = ioctl(fd, TDRV009_SET_BPS, (int)Baudrate);
if (retval != ERROR)
{
    /* function succeeded */
}
else
{
    /* handle the error */
}

...
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The desired baudrate cannot be derived from the selected clock source.

5.5.4 TDRV009_FRAME_READ

This I/O control function reads one data buffer from the internal receive buffer. The function will return immediately, if data is available. If no data is available, the function will wait until data arrives, or the specified timeout happens. The returned data buffer will be available until the next call to this I/O control function. The function specific control parameter **arg** is a pointer to a *TDRV009_DATA_BUFFER* structure.

```
typedef struct
{
    unsigned char *pData;
    unsigned long Length;
    unsigned long Valid;
    int Overflow;
    int Timeout;
} TDRV009_DATA_BUFFER;
```

pData

Pointer to the receive data section. This pointer directly references the driver's internal receive buffer. It points to the beginning of the corresponding data frame. Do not free the associated memory section!

Length

Number of valid data bytes for this data buffer.

Valid

This value specifies if the corresponding data buffer contains valid data, or if the read data buffer also contains a "Frame End". The given values can be binary OR'ed. Possible values are:

Value	Description
TDRV009_RXBUF_DATAVALID	Current data block contains valid (unread) data.
TDRV009_RXBUF_FRAMEEND	Current data block is the last one of a received data frame.

Overflow

This value specifies if a buffer overrun has happened. The automatically stopped receiver is enabled again after the read access.

Timeout

This value specifies the maximum time to wait for incoming data. The timeout is specified in system ticks.

EXAMPLE

```
#include "tdrv009.h"

...

int                fd;
TDRV009_DATA_BUFFER  DataBuf;
int                retval;

...

/*-----
   Read a data buffer. Wait max. 120 ticks.
   -----*/
DataBuf.Timeout = 120;
retval = ioctl(fd, TDRV009_FRAME_READ, (int)&DataBuf);
if (retval != ERROR)
{
    /* function succeeded */
    printf( "%d data bytes received.\n", DataBuf.Length );
    if (DataBuf.Overflow)
    {
        printf( "Data was lost due to a buffer overflow.\n" );
    }
}
else
{
    /* handle the error */
}
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.
EBUSY	The channel is busy with a pending read operation.
EACCES	An external ringbuffer is used, so this function is not supported at the moment.
ETIME	The specified timeout occurred.

5.5.5 TDRV009_FRAME_WRITE

This I/O control function transmits one data buffer. The function will return immediately after handing over the buffer to the driver. It is possible to wait until the supplied data buffer is transferred to the hardware FIFO. This can be done either by waiting on the specified semaphore, or by polling the status parameter. The function specific control parameter **arg** is a pointer to a *TDRV009_TX_DATA_BUFFER* structure.

```
typedef struct
{
    unsigned char *pData;
    unsigned long Length;
    unsigned long Status;
    SEM_ID WaitSema;
} TDRV009_TX_DATA_BUFFER;
```

pData

Pointer to the data section containing the data to be transmitted. This buffer must be physically coherent. Make sure that the data buffer is not modified during transmission.

Length

Number of data bytes for this data buffer.

Status

This value contains the current status of this transmit data packet. Possible values are:

Value	Description
TDRV009_TXDATA_BUSY	Data buffer is currently in use. Do not modify it.
TDRV009_TXDATA_COMPLETED	Data buffer is completed. The data is at least transferred into the hardware FIFO.

WaitSema

This value holds a semaphore created by the user. This semaphore will be signaled after the data buffer is processed.

EXAMPLE

```
#include "tdrv009.h"

int                fd;
TDRV009_TX_DATA_BUFFER TxDataBuf;
unsigned char*    pData;
int               retval, result;

/*-----
   Send a data buffer. Wait max. 120 ticks for completion
   -----*/
pData = cachedmaMalloc( 20*sizeof(unsigned char) );
sprintf(pData, "Hello World!");
TxDataBuf.Status      = 0;
TxDataBuf.WaitSema   = semBCreate(SEM_Q_FIFO, SEM_EMPTY);
TxDataBuf.pData      = pData;
TxDataBuf.Length     = strlen(pData);
retval = ioctl(fd, TDRV009_FRAME_WRITE, (int)&TxDataBuf);
if (retval != ERROR)
{
    /*
     ** function succeeded, wait for completion of the data packet.
     */
    result = semTake( TxDataBuf.WaitSema, 120 );
    if (result == OK)
    {
        printf( "data buffer processed\n" );
    } else {
        printf( "data buffer still busy\n" );
    }
}
else
{
    /* handle the error */
}
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.
EBUSY	The channel is busy with a pending read operation.

5.5.6 TDRV009_WRITEBUF_DONE

This I/O control function checks the current state of a transmit data buffer, which was previously handed over to the driver using the write() function. If the buffer has already been processed (i.e. data was transferred to the hardware FIFO), the function returns OK. If the buffer has not been processed, the function will return ERROR with an appropriate error code. The function dependent parameter **arg** passes an *unsigned char* pointer to the device driver.

EXAMPLE

```
#include "tdrv009.h"

int          fd;
unsigned char* pData;
int          retval;

/*-----
   send TX data buffer
   -----*/
retval = write( fd, pData, ...);
...

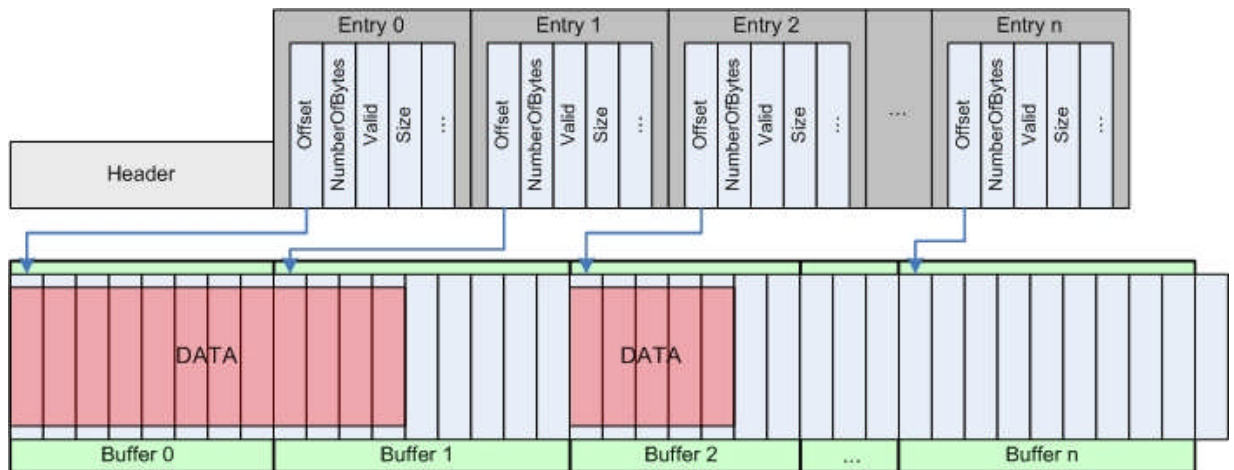

/*-----
   check state of a TX data buffer
   -----*/
retval = ioctl(fd, TDRV009_WRITEBUF_DONE, (int)pData);
if (retval == OK)
{
    /* function succeeded */
    printf( "Data buffer completed.\n" );
}
else
{
    /* handle the error */
}
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied pointer is NULL.
EBUSY	The data buffer is still in use. Do not modify or free the buffer.

5.5.7 TDRV009_RINGBUFFER_REGISTER

This command provides a user-supplied ringbuffer to the driver using a pointer to a dynamic TDRV009_RINGBUFFER structure. The buffer consists of a header and a dynamically expandable data section. The driver formats the allocated buffer automatically according to the specification. The user must ensure that the buffer persists as long as it is registered to the driver. The buffer must be physically coherent, because direct memory access is used. Please refer to the following figure for further information.

The TDRV009_RINGBUFFER structure has the following layout:

```
typedef struct
{
    TDRV009RINGBUFFER_HEADER  Header;
    unsigned char              DataSection[40]; /* dynamically expandable buffer */
} TDRV009_RINGBUFFER;
```

Header

Contains administrative information used for buffer management.

DataSection

Inside the data section the real data buffers and their corresponding entry information is stored.

The TDRV009_RINGBUFFER_HEADER structure has the following layout:

```
typedef struct
{
    unsigned long  BufferSize; /* total size of memory available for data */
    unsigned long  PacketSize; /* size of one data packet, adjusted by driver */
    unsigned long  NumberOfEntries; /* number of entries */
    unsigned long  get; /* index where data can be read */
    unsigned long  put; /* current index where new data is filled in */
    unsigned long  Overflow; /* TRUE if an overflow happened. Receiver is disabled. */
} TDRV009_RINGBUFFER_HEADER;
```

Members (*TDRV009_RINGBUFFER_HEADER*)

BufferSize

Memory size available for the complete data buffers.

PacketSize

Memory size available for one data packet. The complete data buffer is divided into several packets matching the specified *PacketSize*.

NumberOfEntries

Number of available single buffers. This value is calculated out of *BufferSize* and *PacketSize*.
Read Only.

get

Indicates the index where new data can be read out of the ringbuffer.

put

Indicates the index where the driver fills in new arrived data. Read Only.

Overflow

Indicates if a buffer overflow has happened. After a buffer overflow the receiving channel is disabled and must be enabled again by hand. Read Only.

The *TDRV009_RINGBUFFER_ENTRY* structure has the following layout:

```
typedef struct
{
    unsigned long    NumberOfBytes; /* number of valid bytes for the current buffer index */
    unsigned long    Size;         /* total size of the current buffer */
    unsigned long    Offset;       /* offset into the data section where the buffer starts */
    unsigned long    DmaAddress;   /* physical address for the dma controller */
    unsigned long    Valid;       /* TRUE if the current buffer contains valid data */
} TDRV009_RINGBUFFER_ENTRY;
```

Members (*TDRV009_RINGBUFFER_HEADER*)

NumberOfBytes

This value indicates the number of valid bytes inside the corresponding buffer. Read Only.

Size

This value indicates the total size of the corresponding data buffer. Read Only.

Offset

This value specifies the offset relative to the beginning of the data section, where the corresponding data buffer starts. Read Only.

DmaAddress

This value states the physical address of the data buffer used by the DMA controller. Read Only.

Valid

This value indicates if the corresponding data buffer contains valid data. This is the only value that should be modified by the user.

To ensure the correct functionality of the ringbuffer mode, do not change any of the administrative read-only information values.

Assistant Macros and Functions for Buffer handling

To help the user work with this ringbuffer concept some assistant macros and functions were defined in “*tdrv009.h*”. They are explained in the following.

`CALCULATE_RINGBUFFER_SIZE(BufferSize, PacketSize)`
calculates the total size necessary for allocation of the complete ringbuffer

`GET_BUFFER(pRingBuffer, index)`
returns a pointer to the corresponding data buffer

`IS_VALID(pRingBuffer, index)`
TRUE if the corresponding buffer contains valid data, otherwise FALSE

`SET_VALID(pRingBuffer, index, value)`
sets the Valid-flag for the specified entry to *value*

`CLEAR_BUFFER(pRingBuffer, index)`
clears the corresponding data buffer

`GET_POS(pRingBuffer)`
returns the current get-position where new data can be read

`OVERFLOW(pRingBuffer)`
TRUE if a buffer overflow has happened, otherwise false

unsigned char*

`GetNewBuffer(TP862_RINGBUFFER* pRingBuffer, ULONG* length);`
returns a pointer to a buffer containing new data. The *get*-position is set to the next entry, the number of valid bytes is returned in *length*. The previous data buffer is marked as invalid, so the driver may reuse this buffer for data reception.

For further information on how to deal with the ringbuffer, the special assistant macros and functions, please refer to the provided example application.

Example

```
#include "tdrv009.h"

int          fd;
int          retval;
TDRV009_RINGBUFFER* pRingBuffer;

#define BUFFER_SIZE      5000
#define PACKET_SIZE      100

/*-----
  allocate memory for ringbuffer (physically coherent, nonchached):
  5000 bytes total data space
  100 bytes per packet
  -----*/
pRingBuffer = (TDRV009_RINGBUFFER*)cacheDmaMalloc(
                CALCULATE_RINGBUFFER_SIZE( BUFFER_SIZE, PACKET_SIZE )
                );
pRingBuffer->Header.BufferSize = BUFFER_SIZE;
pRingBuffer->Header.PacketSize = PACKET_SIZE;

retval = ioctl( fd, TDRV009_RINGBUFFER_REGISTER, (int)pRingBuffer);
if (retval != OK)
{
    /* process Ioctl error */
}

```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.
EBUSY	A ringbuffer is already registered. Unregister it first.
ENOMEM	Not enough memory available to create necessary receive descriptor list.
EIO	Error during reset or init of the receiver's hardware DMA engine.

5.5.8 TDRV009_RINGBUFFER_UNREGISTER

This command unregisters a previously registered user-ringbuffer. A channel-reset is performed and the driver uses its internal ringbuffer to receive data again. No additional parameter is necessary.

Example

```
#include "tdrv009.h"

int fd;
int retval;

/*
** unregister the ringbuffer
*/
retval = ioctl( fd, TDRV009_RINGBUFFER_UNREGISTER, 0);
if (retval != OK)
{
    /* process Ioctl error */
}
```

ERROR CODES

Error code	Description
EACCES	No external ringbuffer is used, so this function is not supported at the moment.
EIO	Error during reset or init of the receiver's hardware DMA engine.

5.5.9 TDRV009_SET_RECEIVER_STATE

This command sets the channel's receiver either to active or inactive. This function must be called in user-ringbuffer-mode, after a buffer-overflow has happened and free receive buffers are available again.

The parameter **arg** passed to this ioctl function defines the new state of the receiver. Possible values are:

Value	Description
TDRV009_RCVR_ON	The receiver is enabled.
TDRV009_RCVR_OFF	The receiver is disabled.

Example

```
#include "tdrv009.h"
int fd;
int retval;

/*
** enable the receiver
*/
retval = ioctl( fd, TDRV009_SET_RECEIVER_STATE, TDRV009_RCVR_ON);
if (status != OK)
{
    /* process Ioctl error */
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified.

5.5.10 TDRV009_CLEAR_RX_BUFFER

This I/O control function removes all received data from the channels receive buffer, and flushes the hardware FIFO as well. The function dependent argument **arg** is not used for this function.

Example

```
#include "tdrv009.h"

int fd;
int retval;

/*-----
   Clear receive buffer
   -----*/
retval = ioctl( fd, TDRV009_CLEAR_RX_BUFFER, 0);
if (retval != OK)
{
    /* process Ioctl error */
}
```

ERROR CODES

Error code	Description
EIO	Error during reset or init of the receiver's hardware DMA engine.

5.5.11 TDRV009_EEPROM_WRITE

This I/O control function writes one 16bit word into the onboard EEPROM. The first part of the EEPROM is reserved for factory usage, write accesses to this area will result in an error. The function specific control parameter **arg** is a pointer to a *TDRV009_EEPROM_BUFFER* structure.

```
typedef struct
{
    unsigned long   Offset;
    unsigned long   Value;
} TDRV009_EEPROM_BUFFER;
```

Offset

This parameter specifies a 16bit word offset into the EEPROM. Following offsets are available:

Offset	Access
00h – 5Fh	R
60h – 7Fh	R / W

Value

This parameter specifies the 16bit word to be written into the EEPROM at the given offset.

EXAMPLE

```
#include "tdrv009.h"

int          fd;
TDRV009_EEPROM_BUFFER  EepromBuf;
int          retval;

/*-----
   Write a 16bit value into the EEPROM, offset 60h
   -----*/
EepromBuf.Offset = 0x60;
EepromBuf.Value  = 0x1234;
retval = ioctl(fd, TDRV009_EEPROM_WRITE, (int)&EepromBuf);
if (retval != OK)
{
    /* handle the error */
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.
EACCES	The specified offset address is invalid, or read-only.

5.5.12 TDRV009_EEPROM_READ

This I/O control function reads one 16bit word from the onboard EEPROM. The function specific control parameter **arg** is a pointer to a *TDRV009_EEPROM_BUFFER* structure.

```
typedef struct
{
    unsigned long   Offset;
    unsigned long   Value;
} TDRV009_EEPROM_BUFFER;
```

Offset

This parameter specifies a 16bit word offset into the EEPROM. Following offsets are available:

Offset	Access
00h – 5Fh	R
60h – 7Fh	R / W

Value

This parameter returns the 16bit word from the EEPROM at the given offset.

EXAMPLE

```
#include "tdrv009.h"

int          fd;
TDRV009_EEPROM_BUFFER  EepromBuf;
int          retval;

/*-----
   Read a 16bit value into the EEPROM, offset 0
   -----*/
EepromBuf.Offset = 0;
retval = ioctl(fd, TDRV009_EEPROM_READ, (int)&EepromBuf);
if (retval == OK)
{
    printf( "Value = 0x%X\n", EepromBuf.Value );
}
else
{
    /* handle the error */
}
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.
EACCES	Specified offset is invalid, and may not be accessed.

5.5.13 TDRV009_RTS_SET

This I/O control function asserts the RTS handshake signal line of the specific channel. This function is not available if the channel is configured for hardware handshaking. The function dependent argument **arg** is not used for this function.

Example

```
#include "tdrv009.h"

int fd;
int retval;

/*-----
   Assert RTS
   -----*/
retval = ioctl( fd, TDRV009_RTS_SET, 0);
if (retval != OK)
{
    /* process Ioctl error */
}
```

ERROR CODES

Error code	Description
EPERM	The channel is in handshake mode, so this function is not allowed.

5.5.14 TDRV009_RTS_CLEAR

This I/O control function de-asserts the RTS handshake signal line of the specific channel. This function is not available if the channel is configured for hardware handshaking. The function dependent argument **arg** is not used for this function.

Example

```
#include "tdrv009.h"

int fd;
int retval;

/*-----
   De-assert RTS
   -----*/
retval = ioctl( fd, TDRV009_RTS_CLEAR, 0);
if (retval != OK)
{
    /* process Ioctl error */
}
```

ERROR CODES

Error code	Description
EPERM	The channel is in handshake mode, so this function is not allowed.

5.5.15 TDRV009_CTS_GET

This I/O control function returns the current state of the CTS handshake signal line of the specific channel. The function dependent argument **arg** passes a pointer to an *unsigned long* value to the driver. Depending on the state of CTS, either 0 (inactive) or 1 (active) is returned.

Example

```
#include "tdrv009.h"

int          fd;
int          retval;
unsigned long CtsState;

/*-----
   Read CTS state
   -----*/
retval = ioctl( fd, TDRV009_CTS_GET, (int)&CtsState);
if (retval == OK)
{
    printf( "CTS = %ld\n", CtsState );
}
else
{
    /* process Ioctl error */
}
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.

5.5.16 TDRV009_DTR_SET

This I/O control function sets the DTR signal line to HIGH. This function is only available for channel 3. The function dependent argument **arg** is not used for this function.

Example

```
#include "tdrv009.h"

int fd;
int retval;

/*-----
   Set DTR to HIGH (only valid for channel 3)
   -----*/
retval = ioctl( fd, TDRV009_DTR_SET, 0);
if (retval != OK)
{
    /* process Ioctl error */
}
```

ERROR CODES

Error code	Description
ENOTSUP	This function is not supported by the specific channel.

5.5.17 TDRV009_DTR_CLEAR

This I/O control function sets the DTR signal line to LOW. This function is only available for channel 3. The function dependent argument **arg** is not used for this function.

Example

```
#include "tdrv009.h"

int fd;
int retval;

/*-----
   Set DTR to LOW (only valid for channel 3)
   -----*/
retval = ioctl( fd, TDRV009_DTR_CLEAR, 0);
if (retval != OK)
{
    /* process Ioctl error */
}
```

ERROR CODES

Error code	Description
ENOTSUP	This function is not supported by the specific channel.

5.5.18 TDRV009_DSR_GET

This I/O control function returns the current state of the DSR signal line. This function is only available for channel 3. The function dependent argument **arg** passes a pointer to an *unsigned long* value to the driver. Depending on the state of DSR, either 0 (inactive) or 1 (active) is returned.

Example

```
#include "tdrv009.h"

int          fd;
int          retval;
unsigned long DsrState;

/*-----
   Read DSR state
   -----*/
retval = ioctl( fd, TDRV009_DSR_GET, (int)&DsrState);
if (retval == OK)
{
    printf( "DSR = %ld\n", DsrState );
}
else
{
    /* process Ioctl error */
}
}
```

ERROR CODES

Error code	Description
ENOTSUP	This function is not supported by the specific channel.
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.

5.5.19 TDRV009_SET_EXT_XTAL

This I/O control function specifies the frequency of an externally provided clock. This frequency is used for baudrate calculation, and describes the input frequency to the Baud Rate Generator (BRG). The external frequency may be supplied either at input line TxC or RxC. The function dependent argument **arg** passes the clock frequency in Hz.

Example

```
#include "tdrv009.h"

int fd;
int retval;

/*-----
   Specify 1000000Hz as external clock frequency
   -----*/
retval = ioctl( fd, TDRV009_SET_EXT_XTAL, 1000000);
if (retval != OK)
{
    /* process Ioctl error */
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter. The specified frequency must be larger than 0.

5.5.20 TDRV009_REGREAD

This I/O control function reads one 32bit word from the communication controller's register space. The function specific control parameter **arg** is a pointer to a *TDRV009_ADDR_STRUCT* structure.

```
typedef struct
{
    unsigned long   Offset;
    unsigned long   Value;
} TDRV009_ADDR_STRUCT;
```

Offset

This parameter specifies a byte offset into the communication controller's register space. Please refer to the hardware user manual for further information.

Value

This parameter returns the 32bit word from the communication controller's register space.

EXAMPLE

```
#include "tdrv009.h"

int          fd;
TDRV009_ADDR_STRUCT  AddrBuf;
int          retval;

/*-----
   Read a 32bit value (Version Register)
   -----*/
AddrBuf.Offset = 0x00F0;
retval = ioctl(fd, TDRV009_REGREAD, (int)&AddrBuf);
if (retval == OK)
{
    printf( "Value = 0x%lX\n", AddrBuf.Value );
} else {
    /* handle the error */
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.
EACCES	The specified offset is invalid.

5.5.21 TDRV009_REGWRITE

This I/O control function writes one 32bit word to the communication controller's register space. The function specific control parameter **arg** is a pointer to a *TDRV009_ADDR_STRUCT* structure.

```
typedef struct
{
    unsigned long   Offset;
    unsigned long   Value;
} TDRV009_ADDR_STRUCT;
```

Offset

This parameter specifies a byte offset into the communication controller's register space. Please refer to the hardware user manual for further information.

Value

This 32bit word will be written to the communication controller's register space.

Modifying register contents may result in communication problems, system crash or other unexpected behavior.

EXAMPLE

```
#include "tdrv009.h"

int          fd;
TDRV009_ADDR_STRUCT  AddrBuf;
int          retval;

/*-----
   Write a 32bit value (FIFO Control Register 4)
   -----*/
AddrBuf.Offset = 0x0034;
AddrBuf.Value  = 0xffffffff;
retval = ioctl(fd, TDRV009_REGWRITE, (int)&AddrBuf);
if (retval != OK)
{
    /* handle the error */
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.
EACCES	The specified offset is invalid.

5.5.22 TDRV009_WAITFORINTERRUPT

This I/O control function waits until a specified SCC-interrupt or the timeout occurs. The function specific control parameter **arg** is a pointer to a *TDRV009_WAIT_STRUCT* structure.

```
typedef struct
{
    unsigned long   Interrupts;
    int             Timeout;
} TDRV009_WAIT_STRUCT;
```

Interrupts

This parameter specifies interrupt bits to wait for. If one interrupt occurs, the value is returned in this parameter. Please refer to the hardware user manual for further information on the possible SCC interrupt bits.

Timeout

This parameter specifies the time (in system ticks) to wait for an interrupt. If -1 is specified, the function will block indefinitely.

EXAMPLE

```
#include "tdrv009.h"

int             fd;
TDRV009_WAIT_STRUCT   WaitStruct;
int             retval;

/*-----
   Wait at least 60 system ticks for a
   CTS Status Change (CSC) interrupt
   -----*/
WaitStruct.Interrupts = (1 << 14);
WaitStruct.Timeout    = 60;
retval = ioctl(fd, TDRV009_WAITFORINTERRUPT, (int)&WaitStruct);
if (retval == OK)
{
    printf( "Occurred Interrupt = 0x%lX\n", WaitStruct.Interrupts );
}
else
{
    /* handle the error */
}
```

ERROR CODES

Error code	Description
EINVAL	Invalid parameter specified. The supplied buffer pointer is NULL.
EBUSY	Too many simultaneous wait jobs active.
S_objLib_OBJ_TIMEOUT	Timeout happened.
