### **Style Conventions**

Hexadecimal characters are specified with prefix 0x, i.e. 0x029E (that means hexadecimal value 029E).

For signals on hardware products, an 'Active Low' is represented by the signal name with # following, i.e. IP\_RESET#.

Access terms are described as:

# 1 Product Description

The TPMC671 is a standard single-width 32 bit PMC with 16 digital inputs (24V) galvanically isolated from the computer system by optocouplers. The inputs are also potential free to each other. A high performance input circuit ensures a defined switching point and polarization protection against confusing the pole.

All inputs have a common electronic debounce circuit with a freely programmable debounce time.

All inputs can generate an interrupt. The signal edge handling is programmable to interrupt on rising, falling or both edges of the input signal.

The TPMC671 has 16 digital high side or low side switches (build option) with galvanic isolation from the computer system by optocouplers. The outputs are isolated against each other in groups of four outputs. All outputs are protected against short-circuit and thermal overload. The output drivers are capable of driving 0.5A continuous per channel.

A hardware watchdog clears all outputs in case of trigger fail. The TPMC671-1x provides front panel I/O, the TPMC671-2x provides P14 I/O.

## 2 Technical Specification

<b>Mechanical Interface</b>	PCI Mezzanine Card (PMC) Interface Single Size	
<b>Electrical Interface</b>	PCI Rev. 2.1 compliant 33 MHz / 32 bit PCI 3.3V and 5V PCI Signaling Voltage	
<b>On Board Devices</b>		
<b>PCI Target Chip</b>	PCI9030 (PLX Technology)	
<b>I/O Interface</b>		
<b>Number of Inputs</b>	16 digital Inputs	
<b>Input Isolation</b>	Optocouplers for galvanic isolation, also isolated to each other	
<b>Input Voltage</b>	24V DC typical	
<b>Input Current</b>	4.2mA typical at 24V input voltage	
<b>Input Switching Level</b>	12V typical, 7.5V minimum, 14V maximum	
<b>Input Signal Debouncing</b>	Electronic debouncing ( 7µs to 440 ms in steps of 7µs ) common for all input channels, can be disabled	
<b>Input Interrupts</b>	16 input interrupts (Trigger on rising, falling or both edges)	
<b>Outputs</b>	TPMC671-10 / -20	16 digital high side switch Outputs
	TPMC671-11 / -21	16 digital low side switch Outputs
<b>Output Isolation</b>	Optocouplers for galvanic isolation, also isolated to each other in groups of four outputs	
<b>External Output Voltage</b>	24V DC typical, 6V DC minimum, 48V DC maximum	
<b>Output Current</b>	0.5A typical ( 0.3A for voltages over 32V )	
<b>Short Circuit Current</b>	0.8A typical	
<b>Output Voltage Drop</b>	1.1V typical at 0.5A	
<b>Output Protection</b>	Overload, short circuit, GND and Vs open wire protection, thermal shutdown	
<b>I/O Connector</b>	TPMC671-10 / -11	HD68 connector SCSI-3 type connector
	TPMC671-20 / -21	PMC P14 I/O (64 pin Mezzanine connector)
<b>Physical Data</b>		
<b>Power Requirements</b>	85 mA typical @ +3.3V DC with all inputs and outputs inactive 200 mA typical @ +3.3V DC with all inputs and outputs active	
<b>Temperature Range</b>	Operating	-25 °C to +85 °C
	Storage	-55°C to +125°C
<b>MTBF</b>	252000 h	
<b>Humidity</b>	5 – 95 % non-condensing	
<b>Weight</b>	72 g	

Table 2-1 : Technical Specification

# 3 Functional Description

## 3.1 Digital Outputs

### 3.1.1 Optical Isolation

The TPMC671 has 16 high side switch (TPMC671-10/20) or 16 low side switch (TPMC671-11/21) digital outputs. The standard signal level for these outputs is 24V DC. All outputs are isolated by optocouplers from the computer system and are also isolated against each other in groups of four outputs.

GROUP	VS / standard 24V DC	GROUND	OUTPUT
O1	VS_O1	GND_O1	OUT 1 OUT 2 OUT 3 OUT 4
O2	VS_O	GND_O2	OUT 5 OUT 6 OUT 7 OUT 8
O3	VS_O3	GND_O3	OUT 9 OUT 10 OUT 11 OUT 12
O4	VS_O4	GND_O4	OUT 13 OUT 14 OUT 15 OUT 16

Table 3-1 : Isolated Digital Outputs

### 3.1.2 Output Polarity

Each output can be individually switched to the according power supply VS\_Ox (high side switch) or GND\_Ox (low side switch).

### 3.1.3 Overload Protection

The output drivers used on the TPMC671 are smart drivers TDE1707. The maximum continuous output current is 0.5A. The output circuits are protected against overload, short circuit and over temperature. In case of such a failure the corresponding output is switched off until the error condition is removed. Then the output returns automatically to normal operation and the state programmed in the Data Output Register.

For details about the protection of the TDE1707 please refer to the data sheet which is part of the TPMC671-ED Engineering Documentation.

### 3.1.4 Output Watchdog

Writing '1' into bit 1 of the Global Control Register and the following first write access to the Data Output Register enables the hardware watchdog function. The status of the watchdog is indicated at the bit 3 of Global Control Register.

Any software access (read or write) to the Data Output Register of the TPMC670 will retrigger the watchdog. The maximum time between two accesses is set to 120ms, if the time expires without a software access all outputs go into the 'OFF' state. At the same time the watchdog status will change from '0' to '1' and lock the Data Output Register. This prevents a write access to the Data Output Register.

Writing '1' to the watchdog status (Bit 3 Control Register) clears this bit and also unlocks the Output Register. After unlocking the Data Output Register the outputs stay in the 'OFF' state till the next write access to this register.

The watchdog is disabled after power-on or reset.

## 3.2 Digital Inputs

### 3.2.1 Optical Isolation

The TPMC671 has 16 digital inputs. The standard signal level for these inputs is 24V DC. The switching level of the inputs is between 7.5V and 14V. All inputs are isolated by optocouplers from the computer system and are also isolated against each other.

### 3.2.2 Debounce Function

A programmable debounce function common for all inputs is implemented on the TPMC671. There is only one debounce time adjustable for all 16 digital inputs.

If the debounce function is enabled, the input pin must be static for the programmed debounce time before the rising or falling edge is recognized as valid. So only after a correct identification the Data Input Register is updated and an interrupt is generated.

The debounce function is disabled after power-on and reset. The debounce time is set to value '0' after power-on and reset.

### 3.2.3 Interrupt Logic

Interrupt generation can be individually programmed for each channel and input transition. To enable the interrupt after a reset, the Global Interrupt Enable bit in the Control Register must be set to the value '1'. Also the respective bit for rising or falling edge in the Rising Edge / Falling Edge Interrupt Enable Registers must be set.

The Global Interrupt Enable and also all individually interrupt enable bits are disabled after power-on and reset.

## 4 Local Space Addressing

### 4.1 PCI9030 Local Space Configuration

The local on board addressable regions are accessed from the PCI side by using the PCI9030 local spaces.

PCI9030 Local Space	PCI9030 PCI Base Address (Offset in PCI Configuration Space)	PCI Space Mapping	Size (Byte)	Port Width (Bit)	Endian Mode	Description
0	2 (0x18)	IO	16	16	BIG	Local Register Space
1	3 (0x1C)	-	-	-	-	Not Used
2	4 (0x20)	-	-	-	-	Not Used
3	5 (0x24)	-	-	-	-	Not Used

Table 4-1 : PCI9030 Local Space Configuration

### 4.2 Local Register Space Address Map

PCI Base Address: PCI9030 PCI Base Address 2 (Offset 0x18 in PCI Configuration Space).

Offset to PCI Base Address 2	Register Name	Size (Bit)
0x00	Data Output Register	16
0x02	Data Input Register	16
0x04	Control / Status Register	16
0x06	Rising Edge Interrupt Enable Register	16
0x08	Falling Edge Interrupt Enable Register	16
0x0A	Rising Edge Interrupt Status Register	16
0x0C	Falling Edge Interrupt Status Register	16
0x0E	Debounce Time Register	16

Table 4-2 : FPGA Register Space

### 4.2.1 Data Output Register

The Data Output Register is a word wide read/write register that is used to set or clear the different outputs of the TPMC671.

Bit	Symbol	Description	Access	Reset Value
15	OUTPUT16			
14	OUTPUT15			
13	OUTPUT14			
12	OUTPUT13	To set an output line active, write '1' to the corresponding bit. For the inactive state write '0' to the corresponding bit.		
11	OUTPUT12			
10	OUTPUT11			
9	OUTPUT10	0 : inactive 1 : active		
8	OUTPUT9			
7	OUTPUT8			
6	OUTPUT7			
5	OUTPUT6	Bit 0 represents output line 1 and bit 15 represents output line 16.		
4	OUTPUT5			
3	OUTPUT4	After power-on or reset the Data Output Register is cleared to '0', all outputs are inactive.		
2	OUTPUT3			
1	OUTPUT2			
0	OUTPUT1			

Table 4-3 : Data Output Register

## 4.2.2 Data Input Register

The Data Input Register is a word wide read only register that reflects the actual status of the inputs.

Bit	Symbol	Description	Access	Reset Value
15	INPUT16			
14	INPUT15			
13	INPUT14			
12	INPUT13			
11	INPUT12			
10	INPUT11			
9	INPUT10			
8	INPUT9			
7	INPUT8			
6	INPUT7			
5	INPUT6			
4	INPUT5			
3	INPUT4			
2	INPUT3			
1	INPUT2			
0	INPUT1			

Table 4-4 : Data Input Register

### 4.2.3 Control / Status Register

The Control / Status Register is a read/write register.

Bit	Symbol	Description	Access	Reset Value
15 : 4	-	Not used and undefined during reads	-	-
3	WD_STA	Watchdog Status Flag 1 = indicates that the watchdog had recognized a failure and had disabled all output channels. Also the Output Register is locked. Writing '1' to this bit unlocks the Output Register. 0 = signals normal operation	R/W	0
2	DB_ENA	Debounce Enable 1 = enables the debounce function for all 16 inputs 0 = disables debounce function	R/W	0
1	WD_ENA	Watchdog Enable 1 = enables watchdog for all 16 outputs 0 = disables watchdog function	R/W	0
0	INT_ENA	Global Interrupt Enable 1 = globally enables interrupt for all 16 inputs 0 = globally disables interrupts The input channels generate interrupts at pin INTA# of the PCI bus.	R/W	0

Table 4-5 : Control / Status Register

**Additional to this Global Interrupt Enable the Interrupt INTA# must be enabled in the PCI Interrupt Line Register (PCIILR; 0x3C) of the PCI Controller PCI9030. Default after power-on and reset is: INTA# is enabled.**

**The watchdog status is only active if the watchdog is enabled.**

#### 4.2.4 Rising Edge Interrupt Enable Register

The Rising Edge Interrupt Enable Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	INT_ENA_H16			
14	INT_ENA_H15			
13	INT_ENA_H14			
12	INT_ENA_H13			
11	INT_ENA_H12			
10	INT_ENA_H11			
9	INT_ENA_H10			
8	INT_ENA_H9			
7	INT_ENA_H8			
6	INT_ENA_H7			
5	INT_ENA_H6			
4	INT_ENA_H5			
3	INT_ENA_H4			
2	INT_ENA_H3			
1	INT_ENA_H2			
0	INT_ENA_H1			

Table 4-6 : Rising Edge Interrupt Enable Register

#### 4.2.5 Falling Edge Interrupt Enable Register

The Falling Edge Interrupt Enable Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	INT_ENA_L16			
14	INT_ENA_L15			
13	INT_ENA_L14			
12	INT_ENA_L13			
11	INT_ENA_L12			
10	INT_ENA_L11			
9	INT_ENA_L10			
8	INT_ENA_L9			
7	INT_ENA_L8			
6	INT_ENA_L7			
5	INT_ENA_L6			
4	INT_ENA_L5			
3	INT_ENA_L4			
2	INT_ENA_L3			
1	INT_ENA_L2			
0	INT_ENA_L1			

Table 4-7 : Falling Edge Interrupt Enable Register

#### 4.2.6 Rising Edge Interrupt Status Register

The Rising Edge Interrupt Status Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	INT_STA_H16			
14	INT_STA_H15			
13	INT_STA_H14			
12	INT_STA_H13			
11	INT_STA_H12			
10	INT_STA_H11			
9	INT_STA_H10			
8	INT_STA_H9			
7	INT_STA_H8			
6	INT_STA_H7			
5	INT_STA_H6			
4	INT_STA_H5			
3	INT_STA_H4			
2	INT_STA_H3			
1	INT_STA_H2			
0	INT_STA_H1			

Table 4-8 : Rising Edge Interrupt Status Register

#### 4.2.7 Falling Edge Interrupt Status Register

The Falling Edge Interrupt Status Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	INT_STA_L16			
14	INT_STA_L15			
13	INT_STA_L14			
12	INT_STA_L13			
11	INT_STA_L12	Read access: 0 = no interrupt request pending 1 = interrupt request pending		
10	INT_STA_L11			
9	INT_STA_L10	Write access: 0 = no effect 1 = clear pending interrupt request	R/W	0x0000
8	INT_STA_L9			
7	INT_STA_L8			
6	INT_STA_L7			
5	INT_STA_L6			
4	INT_STA_L5			
3	INT_STA_L4			
2	INT_STA_L3			
1	INT_STA_L2			
0	INT_STA_L1	Bit 0 of this register reflects the interrupt request state of input line 1 for the falling edge, bit 15 reflects the interrupt request state of input line 16 for the falling edge. An interrupt request for a specific input line is cleared by writing '1' to the according bit of the Falling Edge Interrupt Status Register.		

Table 4-9 : Falling Edge Interrupt Status Register

#### 4.2.8 Debounce Time Register

The Debounce Time Register is a word wide read/write register.

Bit	Symbol	Description	Access	Reset Value
15	DB_TIME	The debounce time could be programmed by writing a hexadecimal value in the register. One hexadecimal step corresponds to a debounce time of about 7µs.  min debounce time: 7µs max debounce time: 440ms debounce step: ca. 7µs	R/W	0x0000
14				
13				
12				
11				
10				
9				
8				
7				
6				
5				
4				
3				
2				
1				
0				

Table 4-10: Debounce Time Register

To use the programmable debounce time, the Debounce Enable Bit of the Control / Status Register must be set to '1'.

If the Debounce Enable Bit of the Control / Status Register is set to '0', no debounce function is active for all inputs.

The following formulas can be used to determine the preload value.

$$t_{db} = (Z + 1) \cdot \frac{64}{PCICLK} \cdot 3.5$$

$$Z = \frac{t_{db}}{64 \cdot 3.5} \cdot PCICLK - 1$$

$$t_{\max} = (Z + 1) \cdot \frac{64}{PCICLK} \cdot 4$$

$$t_{\min} = (Z + 1) \cdot \frac{64}{PCICLK} \cdot 3$$

t <sub>db</sub>	- typical debounce time [ s ]
Z	- preload value
PCICLK	- 33.33 MHz
t <sub>max</sub>	- max. debounce time [ s ]
t <sub>min</sub>	- min. debounce time [ s ]

Figure 4-1 : Formulas to determine preload value

**Debounce Time Examples:**

typ. Debounce Time [ms]	inaccuracy [ms]	Counter decimal	Counter hex.

  - TPMC671-20: 0x0014
  - TPMC671-21: 0x0015

## 5.1.2 PCI Base Address Initialization

**PCI Base Address Initialization is scope of the PCI host software.**

### PCI9030 PCI Base Address Initialization:

1. Write 0xFFFF\_FFFF to the PCI9030 PCI Base Address Register.
2. Read back the PCI9030 PCI Base Address Register.
3. For PCI Base Address Registers 0:5, check bit 0 for PCI Address Space:
  - Bit 0 = '0' requires PCI Memory Space mapping
  - Bit 0 = '1' requires PCI I/O Space mapping
 For the PCI Expansion ROM Base Address Register, check bit 0 for usage:
  - Bit 0 = '0': Expansion ROM not used
  - Bit 0 = '1': Expansion ROM used
4. For PCI I/O Space mapping, starting at bit location 2, the first bit set determines the size of the required PCI I/O Space size.
  - For PCI Memory Space mapping, starting at bit location 4, the first bit set to '1' determines the size of the required PCI Memory Space size.
  - For PCI Expansion ROM mapping, starting at bit location 11, the first bit set to '1' determines the required PCI Expansion ROM size.
  - For example, if bit 5 of a PCI Base Address Register is detected as the first bit set to '1', the PCI9030 is requesting a 32 byte space (address bits 4:0 are not part of base address decoding).
5. Determine the base address and write the base address to the PCI9030 PCI Base Address Register. For PCI Memory Space mapping the mapped address region must comply with the definition of bits 3:1 of the PCI9030 PCI Base Address Register.

**After programming the PCI9030 PCI Base Address Registers, the software must enable the PCI9030 for PCI I/O and/or PCI Memory Space access in the PCI9030 PCI Command Register (Offset 0x04). To enable PCI I/O Space access to the PCI9030, set bit 0 to '1'. To enable PCI Memory Space access to the PCI9030, set bit 1 to '1'.**

Offset in Config.	Description	Usage
0x10	PCI9030 LCR's MEM	Used
0x14	PCI9030 LCR's I/O	Used
0x18	PCI9030 Local Space 0	Used
0x1C	PCI9030 Local Space 1	Not used
0x30	Expansion ROM	Not used

Table 5-2 : PCI9030 PCI Base Address Usage

## 5.2 Local Configuration Register (LCR)

After reset, the PCI9030 Local Configuration Registers are loaded from the on board serial configuration EEPROM.

**The PCI base address for the PCI9030 Local Configuration Registers is PCI9030 PCI Base Address 0 (PCI Memory Space) (Offset 0x10 in the PCI9030 PCI Configuration Register Space) or PCI9030 PCI Base Address 1 (PCI I/O Space) (Offset 0x14 in the PCI9030 PCI Configuration Register Space).**

**Do not change hardware dependent bit settings in the PCI9030 Local Configuration Registers.**

Offset from PCI Base Address	Register	Value
0x00	Local Address Space 0 Range	0xFFFF_FFF1
0x04	Local Address Space 1 Range	0x0000_0000
0x08	Local Address Space 2 Range	0x0000_0000
0x0C	Local Address Space 3 Range	0x0000_0000
0x10	Local Exp. ROM Range	0x0000_0000
0x14	Local Re-map Register Space 0	0x0000_0001

Table 5-3 : PCI9030 Local Configuration Register

## 5.3 Configuration EEPROM

After power-on or PCI reset, the PCI9030 loads initial configuration register data from the on board configuration EEPROM.

The configuration EEPROM contains the following configuration data:

- Address 0x00 to 0x27 : PCI9030 PCI Configuration Register Values
- Address 0x28 to 0x87 : PCI9030 Local Configuration Register Values
- Address 0x88 to 0xFF : Reserved

See the PCI9030 Manual for more information.

Address	Offset							
	0x00	0x02	0x04	0x06	0x08	0x0A	0x0C	0x0E
0x00	0x029F	0x1498	0x0280	0x0000	0x1180	0x0000	s.b.	0x1498
0x10	0x0000	0x0040	0x0000	0x0100	0x4801	0x0001	0x0000	0x0000

## 5.4 Local Software Reset

The PCI9030 Local Reset Output LRESETo# is used to reset the on board local logic.

The PCI9030 local reset is active during PCI reset or if the PCI Adapter Software Reset bit is set in the PCI9030 local configuration register CNTRL (offset 0x50).

### **CNTRL[30] PCI Adapter Software Reset:**

Value of 1 resets the PCI9030 and issues a reset to the Local Bus (LRESETo# asserted). The PCI9030 remains in this reset condition until the PCI Host clears this bit. The contents of the PCI9030 PCI and Local Configuration Registers are not reset. The PCI9030 PCI Interface is not reset.

# 6 Configuration Hints

## 6.1 Software Reset (Controller and LRESET#)

A host on the PCI bus can set the software reset bit in the Miscellaneous Control Register (CNTRL; 0x50) of the PCI Controller PCI9030 to reset the Controller and assert LRESET# output. The PCI9030 remains in this reset condition until the PCI host clears the software reset bit.

## 6.2 Big / Little Endian

- PCI – Bus ( Little Endian )

Byte 0	AD[7..0]
Byte 1	AD[15..8]
Byte 2	AD[23..16]
Byte 3	AD[31..24]

- Every Local Address Space (0...3) and the Expansion ROM Space can programmed to operate in Big or Little Endian Mode.

BigEndian		LittleEndian	
<b>32 Bit</b>		<b>32 Bit</b>	
Byte 0	D[31..24]	Byte 0	D[7..0]
Byte 1	D[23..16]	Byte 1	D[15..8]
Byte 2	D[15..8]	Byte 2	D[23..16]
Byte 3	D[7..0]	Byte 3	D[31..24]
<b>16 Bit upper lane</b>		<b>16 Bit</b>	
Byte 0	D[31..24]	Byte 0	D[7..0]
Byte 1	D[23..16]	Byte 1	D[15..8]
<b>16 Bit lower lane</b>			
Byte 0	D[15..8]		
Byte 1	D[7..0]		
<b>8 Bit upper lane</b>		<b>8 Bit</b>	
Byte 0	D[31..24]	Byte 0	D[7..0]
<b>8 Bit lower lane</b>			
Byte 0	D[7..0]		

Table 6-1 : Local Bus Little/Big Endian

---

**Standard use of the TPMC671:**

Local Address Space 0	16 bit bus in Big Endian Mode
Local Address Space 1	not used
Local Address Space 2	not used
Local Address Space 3	not used
Expansion ROM Space	not used

To change the Endian Mode use the Local Configuration Registers for the corresponding Space. Bit 24 of the according register sets the Mode. A value of 1 indicates Big Endian and a value of 0 indicates Little Endian.

For further information please refer to the PCI9030 manual which is also part of the TPMC671-ED Engineering Documentation.

Use the PCI Base Address 0 + Offset or PCI Base Address 1 + Offset:

Short cut Offset	Name
LAS0BRD	0x28 Local Address Space 0 Bus Region Description Register
LAS1BRD	0x2C Local Address Space 0 Bus Region Description Register
LAS2BRD	0x30 Local Address Space 0 Bus Region Description Register
LAS3BRD	0x34 Local Address Space 0 Bus Region Description Register
EROMBRD	0x38 Expansion ROM Bus Region Description Register

You could also use the PCI - Base Address 1 I/O Mapped Configuration Registers.
