1 Introduction

The TPMC851-SW-82 Linux device driver allows the operation of the TPMC851 PMC conforming to the Linux I/O system specification. This includes a device-independent basic I/O interface with *open()*, *close()* and *ioctl()* functions.

Special I/O operation that do not fit to the standard I/O calls will be performed by calling the *ioctl()* function with a specific function code and an optional function dependent argument.

The TPMC851-SW-82 device driver supports the following features:

- Executing AD conversion and reading input value
- Setting up, Starting and Stopping ADC Input Sequencer
- Configuring ADC Sequencer Trigger I/O
- Reading ADC Sequencer input data
- Setting output value and starting DA conversion
- Setting up, Starting and Stopping DAC Output Sequencer
- Configuring DAC Sequencer Trigger I/O
- Setting DAC Sequencer Data
- Reading digital I/O data
- Setting digital output data
- Configuring I/O direction and input debouncer
- Waiting for input events
- Reading counter value
- Resetting counter value
- Configuring counter mode and controls
- Setting preload and match value
- Waiting for counter events

The TPMC851-SW-82 device driver supports the modules listed below:

TPMC851	16(32) ADC, 8 DAC, 16 I/O, 1 counter	(PMC)
---------	--------------------------------------	-------

To get more information about the features and use of TPMC851 device it is recommended to read the manuals listed below.

[TPMC851 User manual](#)
[TPMC851 Engineering Manual](#)

2 Installation

Following files are located on the distribution media:

Directory path 'TPMC851-SW-82':

TPMC851-SW-82-SRC.tar.gz	GZIP compressed archive with driver source code
TPMC851-SW-82-1.0.3.pdf	PDF copy of this manual
Release.txt	Release information
ChangeLog.txt	Release history

For installation the files have to be copied to the desired target directory.

The GZIP compressed archive TPMC851-SW-82-SRC.tar.gz contains the following files and directories:

Directory path './TPMC851/':

tpmc851.c	TPMC851 device driver source
tpmc851def.h	TPMC851 driver include file
tpmc851.h	TPMC851 include file for driver and application
makenode	Script to create device nodes on the file system
Makefile	Device driver make file
example/tpmc851exa.c	Example application
include/config.h	Driver independent library header file
include/tpmodule.h	Driver and kernel independent library header file
include/tpmodule.c	Driver and kernel independent library source file
include/tpxxhwdep.h	HAL library header file
include/tpxxhwdep.c	HAL library source file

In order to perform an installation, extract all files of the archive TPMC851-SW-82-SRC.tar.gz to the desired target directory. The command 'tar -xzvf TPMC851-SW-82-SRC.tar.gz' will extract the files into the local directory.

- Login as *root* and change to the target directory
- Copy tpmc851.h to */lib/modules/<version>/build/include* and */usr/include*

2.1 Build and install the device driver

- Login as *root*
- Change to the target directory
- To create and install the driver in the module directory */lib/modules/<version>/misc* enter:

make install

- To update the device driver's module dependencies, enter:
depmod -aq

2.2 Uninstall the device driver

- Login as *root*
- Change to the target directory
- To remove the driver from the module directory */lib/modules/<version>/misc* enter:
make uninstall

2.3 Install device driver into the running kernel

- To load the device driver into the running kernel, login as root and execute the following commands:
modprobe tpmc851drv
- After the first build or if you are using dynamic major device allocation it's necessary to create new device nodes on the file system. Please execute the script file *makenode*, which resides in *Serial/* directory, to do this. If your kernel has enabled a device file system (*devfs* or *sysfs* with *udev*) then you have to skip running the *makenode* script. Instead of creating device nodes from the script the driver itself takes creating and destroying of device nodes in its responsibility.

sh makenode

On success the device driver will create a minor device for each compatible channel found. The first PMC module can be accessed with device node */dev/tpmc851_0*, the second module with device node */dev/tpmc851_1* and so on. The assignment of device nodes to physical PMC modules depends on the search order of the PCI bus driver.

2.4 Remove device driver from the running kernel

- To remove the device driver from the running kernel login as root and execute the following command:

modprobe -r tpmc851drv

If your kernel has enabled *devfs* or *sysfs* (*udev*), all */dev/tpmc851_** nodes will be automatically removed from your file system after this.

Be sure that the driver isn't opened by any application program. If opened you will get the response “*tpmc851drv: Device or resource busy*” and the driver will still remain in the system until you close all opened files and execute *modprobe -r* again.

2.5 Change Major Device Number

This paragraph is only for Linux kernels without DEVFS installed.

The TPMC851 driver uses dynamic allocation of major device numbers per default. If this isn't suitable for the application it's possible to define a major number for the driver.

To change the major number edit the file tpmc851def.h, change the following symbol to appropriate value and enter make install to create a new driver.

TPMC851_MAJOR	Valid numbers are in range between 0 and 255. A value of 0 means dynamic number allocation.
---------------	---

Example:

```
#define TPMC851_MAJOR 122
```

Be sure that the desired major number isn't used by other drivers. Please check /proc/devices to see which numbers are free.

Keep in mind that's necessary to create new device nodes if the major number for the TPMC851 driver has changed and the makenode script isn't used.

3 I/O Functions

This chapter describes the interface to the device driver I/O system.

3.1 open()

NAME

`open()` - open a file descriptor

SYNOPSIS

```
#include <fcntl.h>  
  
int open (const char *filename, int flags)
```

DESCRIPTION

The `open` function creates and returns a new file descriptor for the file named by *filename*. The *flags* argument controls how the file is to be opened. This is a bit mask; you create the value by the bitwise OR of the appropriate parameters (using the | operator in C).

See also the GNU C Library documentation for more information about the `open` function and open flags.

EXAMPLE

```
int fd;  
  
...  
  
fd = open( "/dev/tPMC851_0" , O_RDWR );  
if (fd == -1)  
{  
    /* handle error condition */  
}
```

RETURNS

The normal return value from `open` is a non-negative integer file descriptor. In the case of an error, a value of `-1` is returned. The global variable `errno` contains the detailed error code.

ERRORS

E_NODEV The requested minor device does not exist.

This is the only error code returned by the driver, other codes may be returned by the I/O system during open. For more information about open error codes, see the *GNU C Library description – Low-Level Input/Output*.

SEE ALSO

[GNU C Library description – Low-Level Input/Output](#)

3.2 close()

NAME

close() – close a file descriptor

SYNOPSIS

```
#include <unistd.h>
int close (int filedes)
```

DESCRIPTION

The close function closes the file descriptor *filedes*.

EXAMPLE

```
int fd;
...
if (close(fd) != 0) {
    /* handle close error conditions */
}
```

RETURNS

The normal return value from close is 0. In the case of an error, a value of -1 is returned. The global variable *errno* contains the detailed error code.

ERRORS

E_NODEV	The requested minor device does not exist.
---------	--

This is the only error code returned by the driver, other codes may be returned by the I/O system during close. For more information about close error codes, see the *GNU C Library description – Low-Level Input/Output*.

3.3 ioctl()

NAME

ioctl() – device control functions

SYNOPSIS

```
#include <sys/ioctl.h>
int ioctl(int filedes, int request [, void *argp])
```

DESCRIPTION

The **ioctl** function sends a control code directly to a device, specified by *filedes*, causing the corresponding device to perform the requested operation.

The argument *request* specifies the control code for the operation. The optional argument *argp* depends on the selected request and is described for each request in detail later in this chapter.

The following ioctl codes are defined in *tpmc851.h*:

Symbol	Meaning
<i>TPMC851_IOC_ADC_READ</i>	Read value from ADC channel
<i>TPMC851_IOC_ADC_SEQCONFIG</i>	Configure ADC sequencer channel
<i>TPMC851_IOC_ADC_SEQSTART</i>	Start ADC sequencer
<i>TPMC851_IOC_ADC_SEQSTOP</i>	Stop ADC sequencer
<i>TPMC851_IOC_ADC_SEQREAD</i>	Read values from ADC sequencer buffer
<i>TPMC851_IOC_DAC_WRITE</i>	Write value to DAC channel
<i>TPMC851_IOC_DAC_SEQCONFIG</i>	Configure DAC sequencer channel
<i>TPMC851_IOC_DAC_SEQSTART</i>	Start DAC sequencer
<i>TPMC851_IOC_DAC_SEQSTOP</i>	Stop DAC sequencer
<i>TPMC851_IOC_DAC_SEQWRITE</i>	Write values to DAC sequencer buffer
<i>TPMC851_IOC_DAC_SEQSTATE</i>	Get DAC sequencer and information
<i>TPMC851_IOC_IO_READ</i>	Read from digital I/O
<i>TPMC851_IOC_IO_WRITE</i>	Write to digital I/O
<i>TPMC851_IOC_IO_EVENTWAIT</i>	Wait for I/O event
<i>TPMC851_IOC_IO_CONFIG</i>	Configure digital I/O
<i>TPMC851_IOC_IO_DEBCONFIG</i>	Configure digital I/O (input) debouncer

(continued on the next page)

(... *continued*)

<i>TPMC851_IOC_CNT_READ</i>	Read value from counter/timer
<i>TPMC851_IOC_CNT_MATCHWAIT</i>	Wait for counter match event
<i>TPMC851_IOC_CNT_CTRLWAIT</i>	Wait for counter control event
<i>TPMC851_IOC_CNT_CONFIG</i>	Configure counter
<i>TPMC851_IOC_CNT_RESET</i>	Reset counter
<i>TPMC851_IOC_CNT_SETPRELD</i>	Set counter preload value
<i>TPMC851_IOC_CNT_SETMATCH</i>	Set counter match value

See behind for more detailed information on each control code.

To use these TPMC851 specific control codes the header file tpmc851.h must be included in the application.

RETURNS

On success, zero is returned. In the case of an error, a value of -1 is returned. The global variable *errno* contains the detailed error code.

ERRORS

<i>EINVAL</i>	Invalid argument. This error code is returned if the requested ioctl function is unknown. Please check the argument <i>request</i>
<i>EFAULT</i>	Parameter data can not be copied to the drivers context

Other function dependent error codes will be described for each ioctl code separately. Note, the TPMC851 driver always returns standard Linux error codes.

SEE ALSO

ioctl man pages

3.3.1 TPMC851_IOC_ADC_READ

NAME

TPMC851_IOC_ADC_READ – Read value from ADC channel

DESCRIPTION

This function starts an ADC conversion with specified parameters, waits for completion and returns the value.

The ADC sequencer must be stopped for single ADC conversions.

A pointer to the read structure (*TPMC851_ADC_READ_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    int             channel;
    int             gain;
    unsigned long   flags;
    short           adcValue;
} TPMC851_ADC_READ_BUF;
```

channel

Specifies the ADC channel number. Valid values are 1..16 for differential input and 1..32 for single-ended input.

gain

Specifies the input gain. Valid gain values are 1, 2, 4, and 8.

flags

Is an ored value of the following flags:

flag	description
<i>TPMC851_F_CORR</i>	If set the function will return a corrected value of the input data in <i>adcValue</i> . Factory set and module dependent correction data is used for correction. If not set, the raw value read from the module will be returned in <i>adcValue</i> .
<i>TPMC851_F_IMMREAD</i>	If set the driver will start the conversion without waiting for settling time. This should only be used if the previous conversion has used the same interface parameters (channel, gain, differential/single-ended). If not set the driver will use the automatic mode, which sets interface configuration, waits settling time and then starts the conversion.
<i>TPMC851_F_DIFF</i>	If set the input channel will be a differential input. If not set the input channel will be a single-ended input.

adcValue

This value will return the read ADC value.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_ADC_READ_BUF    adcReadBuf;

/* Read a corrected value from differential channel 2, use a gain of 4 */
adcReadBuf.channel = 2;
adcReadBuf.gain    = 4;
adcReadBuf.flags   = TPMC851_F_CORR | TPMC851_F_DIFF;

printf("Read from ADC ... ");
result = ioctl(fd,
               TPMC851_IOC_ADC_READ,
               &adcReadBuf);

if (result >= 1)
{
    printf("OK\n");
    printf("      ADC-value: %d", adcReadBuf.adcValue);
}
else
{
    /* process ioctl error */
}
```

ERRORS

EBUSY	The ADC sequencer is currently running
ECHRNG	Specified channel is invalid
EINVAL	Specified gain level is invalid
ETIME	The ADC conversion timed out

3.3.2 TPMC851_IOC_ADC_SEQCONFIG

NAME

TPMC851_IOC_ADC_SEQCONFIG – Configure ADC sequencer channel

DESCRIPTION

This function enables and configures, or disables an ADC channel for sequence use.

The ADC sequencer must be stopped to execute this function.

A pointer to the configuration structure (*TPMC851_ADC_SEQCONFIG_BUF*) is passed by the parameter *arg* to the driver.

`typedef struct`

```
{
    int          channel;
    int          enable;
    int          gain;
    unsigned long flags;
} TPMC851_ADC_SEQCONFIG_BUF;
```

channel

Specifies the ADC channel number to configure. Valid values are 1..16 for differential input and 1..32 for single-ended input.

enable

Specifies if the channel shall be used in sequencer mode or not. (0 disables the channel any other value will enable the channel)

gain

Specifies the input gain. Valid gain values are 1, 2, 4, and 8.

flags

Is an ored value of the following flags:

flag

TPMC851_F_CORR

description

If set the sequencer will return a corrected value for the specified channel. Factory set and module dependent correction data is used for correction.

If not set, the raw value read from the module will be returned.

TPMC851_F_DIFF

If set the input channel will be a differential input.

If not set the input channel will be a single-ended input.

EXAMPLE

```
#include "tpmc851.h"

int fd;
int result;
TPMC851_ADC_SEQCONFIG_BUF adcSeqConfBuf;

/*
** Configure single-ended channel 3, using a gain of 4 and returning
** corrected data when the sequencer is running
*/
adcSeqConfBuf.channel = 3;
adcSeqConfBuf.enable = TRUE;
adcSeqConfBuf.gain = 4;
adcSeqConfBuf.flags = TPMC851_F_CORR;

printf("Configure channel for Sequencer ... ");
result = ioctl(fd,
               TPMC851_IOC_ADC_SEQCONFIG,
               &adcSeqConfBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

EBUSY	The ADC sequencer is currently running
ECHRNG	Specified channel is invalid
EINVAL	Specified gain level or flags are invalid

3.3.3 TPMC851_IOC_ADC_SEQSTART

NAME

TPMC851_IOC_ADC_SEQSTART – Start ADC sequencer

DESCRIPTION

This function configures the ADC sequencer time and starts the ADC sequencer.

A pointer to the start structure (*TPMC851_ADC_SEQSTART_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned short          cycTime;
    unsigned long           flags;
    long                   bufSize;
} TPMC851_ADC_SEQSTART_BUF;
```

cycTime

Specifies the ADC sequencer cycle time. The sequencer time is specified in 100µs steps. With a value of 0, the “Sequencer Continuous Mode” is selected.

flags

Is an ored value of the following flags:

flag	description
<i>TPMC851_F_EXTTRIGSRC</i>	If set the ADC sequencer is trigger with digital I/O line 0. If not set, the ADC sequencer uses the ADC cycle counter.
<i>TPMC851_F_EXTTRIGOUT</i>	If set the ADC trigger is used as output on digital I/O line 0.

***TPMC851_F_EXTTRIGSRC* and *TPMC851_F_EXTTRIGOUT* can not be used at the same time.**

bufSize

Specifies the internal ADC sequencer buffer size. The sequencer stores the incoming values inside an internal buffer, from where the user application retrieves the data (refer to ioctl function TPMC851_C_ADC_SEQREAD).

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_ADC_SEQSTART_BUF    adcSeqStartBuf;

/*
** Start sequencer with a buffer of 100 word and a cycle time of 100 ms,
** do not use external trigger
*/
adcSeqStartBuf.cycTime      = 1000;
adcSeqStartBuf.flags        = 0;
adcSeqStartBuf.bufSize      = 100;

printf("Start ADC Sequencer ... ");
result = ioctl(fd,
               TPMC851_C_ADC_SEQSTART,
               &adcSeqStartBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

EBUSY	The ADC sequencer is currently running
EINVAL	Specified gain level or flags are invalid
ENOMEM	No memory is available to allocate the internal buffer

3.3.4 TPMC851_IOC_ADC_SEQSTOP

NAME

TPMC851_IOC_ADC_SEQSTOP – Stop ADC sequencer

DESCRIPTION

This function stops the ADC sequencer. All sequencer channel configurations are still valid after stopping.

No additional parameter is necessary.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;

/*
 ** Stop the sequencer
 */
printf("Stop ADC Sequencer ... ");
result = ioctl(    fd,
                  TPMC851_IOC_ADC_SEQSTOP,
                  NULL);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

EACCES	The ADC sequencer is not running
--------	----------------------------------

3.3.5 TPMC851_IOC_ADC_SEQREAD

NAME

TPMC851_IOC_ADC_SEQREAD – Read values from ADC sequencer buffer

DESCRIPTION

This function reads values from the internal ADC sequencer buffer.

A pointer to the read structure (*TPMC851_ADC_SEQREAD_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    long          seqState;
    short         buffer[32];
} TPMC851_ADC_SEQREAD_BUF;
```

seqState

Displays the sequencer state. This is an ored value of the following status flags.

flag	description
<i>TPMC851_SF_SEQACTIVE</i>	If set the ADC sequencer is started. If not set, the ADC sequencer stopped.
<i>TPMC851_SF_SEQOVERFLOWERR</i>	If set the ADC sequencer has detected an overflow error. (Hardware detected)
<i>TPMC851_SF_SEQTIMERERROR</i>	If set the ADC sequencer has detected a timer error. (Hardware detected)
<i>TPMC851_SF_SEQIRAMERROR</i>	If set the ADC sequencer has detected an instruction RAM error. (Hardware detected)
<i>TPMC851_SF_SEQFIFO_OVERFLOW</i>	If set the internal FIFO (<i>buffer</i>) has overrun. Data got lost.

buffer[]

This array contains data from the activated channels. Only the previously selected channels contain valid data. Array index 0 contains values from channel 1, array index 1 corresponds to channel 2 and so on.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_ADC_SEQREAD_BUF adcSeqReadBuf;

/*
** Read values from internal sequencer buffer (1000 times)
** assuming that channel 1 and 3 are enabled.
*/
for (cycle=0; cycle<1000; cycle++)
{
    result = ioctl(      fd,
                        TPMC851_IOC_ADC_SEQREAD,
                        (char*)&adcSeqReadBuf );
    if (result >= 1)
    {
        printf("    Channel(1)=%d      Channel(3)=%d\n",
               adcSeqReadBuf.buffer[0],
               adcSeqReadBuf.buffer[2] );
    }
    if (result == ENODATA)
    {
        /* wait a short time for new data to arrive */
    }
}
```

ERRORS

EACCES	The ADC sequencer is not running
ENODATA	No data is available inside the internal buffer

3.3.6 TPMC851_IOC_DAC_WRITE

NAME

TPMC851_IOC_DAC_WRITE – Write value to DAC channel

DESCRIPTION

This function writes a value to the DAC register.

The DAC sequencer must be stopped for single DAC writes.

A pointer to the write structure (*TPMC851_DAC_WRITE_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    int             channel;
    unsigned long   flags;
    short           dacValue;
} TPMC851_DAC_WRITE_BUF;
```

channel

Specifies the DAC channel number. Valid values are 1..8.

flags

Is an ored value of the following flags:

flag	description
<i>TPMC851_F_CORR</i>	If set the function will correct the <i>dacValue</i> before writing to DAC channel. Factory set and module dependent correction data is used for correction. If not set, <i>dacValue</i> is written to the DAC channel.
<i>TPMC851_F_NOUPDATE</i>	If set the DACs will not update after changing the DAC value. The output voltage will change with the next write with unset <i>TPMC851_F_NOUPDATE</i> flag. If not set the DAC will immediately convert and output the new voltage.

dacValue

This value is written to the DAC channel.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_DAC_WRITE_BUF  dacWriteBuf;

/*
** Write uncorrected 0x4000 to DAC channel 5, immediate convert
*/
dacWriteBuf.channel      = 5;
dacWriteBuf.flags        = 0;
dacWriteBuf.dacValue     = 0x4000;

printf("Write to DAC ... ");
result = ioctl(    fd,
                  TPMC851_IOC_DAC_WRITE,
                  (char*)&dacWriteBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

EBUSY	The DAC sequencer is currently running
ECHRNG	Specified channel is invalid
EINVAL	Specified gain level is invalid

3.3.7 TPMC851_IOC_DAC_SEQCONFIG

NAME

TPMC851_IOC_DAC_SEQCONFIG – Configure DAC sequencer channel

DESCRIPTION

This function enables and configures, or disables a DAC channel for sequence use.

The DAC sequencer must be stopped to execute this function.

A pointer to the configuration structure (*TPMC851_DAC_SEQCONFIG_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    int             channel;
    int             enable;
    unsigned long   flags;
} TPMC851_DAC_SEQCONFIG_BUF;
```

channel

Specifies the DAC channel number to configure. Valid values are 1..8.

enable

Specifies if the channel shall be used in sequencer mode or not. (0 disables the channel, any other value will enable the channel)

flags

Is an ored value of the following flags:

flag

TPMC851_F_CORR

description

If set the function will correct the dacValue before writing to DAC channel. Factory set and module dependent correction data is used for correction.
If not set, dacValue is written to the DAC channel.

EXAMPLE

```
#include "tpmc851.h"

int                      fd;
int                      result;
TPMC851_DAC_SEQCONFIG_BUF    dacSeqConfBuf;

/*
 ** Configure DAC channel 1, using corrected data
 ** when the sequencer is running
 */
dacSeqConfBuf.channel    = 1;
dacSeqConfBuf.enable      = TRUE;
dacSeqConfBuf.flags       = TPMC851_F_CORR;

printf("Configure channel for Sequencer ... ");
result = ioctl(fd,
               TPMC851_IOC_DAC_SEQCONFIG,
               (char*)&dacSeqConfBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

EBUSY	The DAC sequencer is currently running
ECHRNG	Specified channel is invalid
EINVAL	Specified gain level is invalid

3.3.8 TPMC851_IOC_DAC_SEQSTART

NAME

TPMC851_IOC_DAC_SEQSTART – Start DAC sequencer

DESCRIPTION

This function configures the DAC sequencer time and starts the DAC sequencer.

A pointer to the start structure (*TPMC851_DAC_SEQSTART_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned short          cycTime;
    unsigned long           flags;
    long                   bufSize;
    short                  *buffer;
} TPMC851_DAC_SEQSTART_BUF;
```

cycTime

Specifies the DAC sequencer cycle time. The sequencer time is specified in 100µs steps. With a value of 0, the “Sequencer Continuous Mode” is selected.

flags

Is an ored value of the following flags:

flag	description
<i>TPMC851_F_EXTTRIGSRC</i>	If set the DAC sequencer is trigger with digital I/O line 1. If not set, the DAC sequencer uses the DAC cycle counter.
<i>TPMC851_F_EXTTRIGOUT</i>	If set the DAC trigger is used as output on digital I/O line 1.
<i>TPMC851_F_DACSEQREPEAT</i>	If set the DAC will repeat data when the end of the buffer is reached, the <i>TPMC851_SF_SEQFIFOUNDERFLOW</i> error will be suppressed.

***TPMC851_F_EXTTRIGSRC* and *TPMC851_F_EXTTRIGOUT* can not be used at the same time.**

bufSize

This value specifies the size of the DAC sequencer FIFO. The value is specified in number of data words.

buffer

Pointer to a buffer of short values used for initial DAC sequencer data.

The DAC data is stored by the application into this buffer and copied to the drivers FIFO. The assignment from data to channel is done as follows. The first data will be used for the lowest enabled channel, the second from the next enabled channel and so on. There will be no data used for disabled channels. If the end of *buffer* is reached the next data will be read again from the beginning of the buffer.

Example:

Enabled channels: 1, 2, 5

Buffer Size: 10

The table shows the index the data is used to for channel and cycle.

sequencer cycle	channel 1	channel 2	channel 3
1st	0	1	2
2nd	3	4	5
3rd	6	7	8
4th	9	0	1
5th	2	3	4
...

EXAMPLE

```
#include "tpmc851.h"

int fd;
int result;
TPMC851_DAC_SEQSTART_BUF dacSeqStartBuf;
short buffer[1000];

/*
** Start sequencer with a buffer of 100 word and a cycle time of 100 ms,
** do not use external trigger
*/
/* Fill buffer */
buffer[0] = ...;
buffer[1] = ...;
buffer[2] = ...;

...

```

```
...
dacSeqStartBuf.cycTime      = 1000;
dacSeqStartBuf.flags        = TPMC851_F_DACSEQREPEAT;
dacSeqStartBuf.bufSize      = 1000;
dacSeqStartBuf.buffer       = buffer;

printf("Start DAC Sequencer ... ");
result = ioctl(    fd,
                  TPMC851_IOC_DAC_SEQSTART,
                  (char*)&dacSeqStartBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

EBUSY	The DAC sequencer is already running
EINVAL	Specified flags are invalid
ENOMEM	No memory is available to allocate the internal buffer

3.3.9 TPMC851_IOC_DAC_SEQSTOP

NAME

TPMC851_IOC_DAC_SEQSTOP – Stop DAC sequencer

DESCRIPTION

This function stops the DAC sequencer. All sequencer channel configurations are still valid after stopping.

No additional parameter is necessary.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;

/*
 ** Stop the sequencer
 */
printf("Stop DAC Sequencer ... ");
result = ioctl(    fd,
                  TPMC851_IOC_DAC_SEQSTOP,
                  NULL);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

EACCES	The DAC sequencer is not running
--------	----------------------------------

3.3.10 TPMC851_IOC_DAC_SEQWRITE

NAME

TPMC851_IOC_DAC_SEQWRITE – Write values to DAC sequencer buffer

DESCRIPTION

This function writes values to the internal DAC sequencer buffer.

A pointer to the write structure (*TPMC851_DAC_SEQWRITE_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    long          bufSize;
    short         *buffer;
} TPMC851_DAC_SEQREAD_BUF;
```

bufSize

This value specifies the size of the data buffer. The driver will only accept buffer sizes smaller or equal to the free number of element in the drivers FIFO. The number of free elements can be read with *TPMC851_IOC_DAC_SEQSTATE*.

buffer

This pointer points the buffer containing the new DAC data values for the activated channels. The data is supplied in the way as described in *TPMC851_IOC_DAC_SEQSTART*.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_DAC_SEQWRITE_BUF   dacSeqWriteBuf;
short                buffer[100];

/*
 ** Fill up 100 data values
 */
/* fill first cycle */
buffer[0] = ...;
buffer[1] = ...;
buffer[2] = ...;

...
```

```
...  
  
dacSeqWriteBuf.bufSize  = 100;  
dacSeqWriteBuf.buffer   = buffer;  
result = ioctl(    fd,  
                  TPMC851_IOC_DAC_SEQWRITE,  
                  (char*)&dacSeqWriteBuf);  
  
if (result >= 1)  
{  
    /* OK, FIFO filled up */  
}  
else  
{  
    /* Filling up failed */  
}
```

ERRORS

EACCES	The DAC sequencer is not running
EINVAL	Invalid buffer size specified
EFAULT	Additional: There is not enough space in FIFO to copy the supplied data buffer

3.3.11 TPMC851_IOC_DAC_SEQSTATE

NAME

TPMC851_IOC_DAC_SEQSTATE – Get DAC sequencer and information

DESCRIPTION

This function reads the state and number of free elements of the DAC sequencer.

A pointer to the state structure (*TPMC851_DAC_SEQSTATE_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned long          state;
    short                  freeElems;
} TPMC851_DAC_SEQSTATE_BUF;
```

state

This value returns the actual state of the DAC sequencer. The following flags can be ored in the value:

flag	description
<i>TPMC851_SF_SEQACTIVE</i>	If set the DAC sequencer is started. If not set, the DAC sequencer stopped.
<i>TPMC851_SF_SEQUNDERFLOWERR</i>	If set the DAC sequencer has detected an underrun error. (Hardware detected)
<i>TPMC851_SF_SEQFIFOUNDERFLOW</i>	If set the application supplied FIFO (<i>buffer</i>) is empty and the sequencer could not write new data.

freeElems

This value returns the number of free data elements in the DAC sequencer FIFO.

EXAMPLE

```
#include "tpmc851.h"

int                      fd;
int                      result;
TPMC851_DAC_SEQSTATE_BUF    dacSeqStatBuf;

/*
** read DAC sequencer state
*/
result = ioctl(      fd,
                     TPMC851_IOC_DAC_SEQSTATE,
                     (char*)&dacSeqStatBuf);

if (result >= 1)
{
    /* OK */
    printf ("State: %Xh, free: %d\n",
           dacSeqStatBuf.state,
           dacSeqStatBuf.freeElems);
}
else
{
    /* Failed */
}
```

3.3.12 TPMC851_IOC_IO_READ

NAME

TPMC851_IOC_IO_READ – Read from digital I/O

DESCRIPTION

This function reads the current value of the digital I/O input. Only bits previously configured to *input* are valid.

A pointer to the read structure (*TPMC851_IO_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned short          value;
} TPMC851_IO_BUF;
```

value
Returns the current digital I/O input value.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_IO_BUF      ioBuf;

/* Read I/O input value */
printf("Read I/O input value ... ");
result = ioctl(    fd,
                  TPMC851_IOC_IO_READ,
                  (char*)&ioBuf);

if (result >= 1)
{
    printf("    I/O input: %04X", ioBuf.value);
}
else
{
    /* process ioctl error */
}
```

3.3.13 TPMC851_IOC_IO_WRITE

NAME

TPMC851_IOC_IO_WRITE – Write to digital I/O

DESCRIPTION

This function writes a value to the digital I/O output. Only bits previously configured to *output* are valid.

A pointer to the write structure (*TPMC851_IO_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned short          value;
} TPMC851_IO_BUF;
```

value
Specifies the new digital I/O output value.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_IO_BUF      ioBuf;

/* Write 0x1234 to I/O output */
ioBuf.value = 0x1234;
printf("Write I/O output value ... ");
result = ioctl(fd,
               TPMC851_IOC_IO_WRITE,
               (char*)&ioBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

3.3.14 TPMC851_IOC_IO_EVENTWAIT

NAME

TPMC851_IOC_IO_EVENTWAIT – Wait for digital I/O event

DESCRIPTION

This function waits for an I/O input event.

A pointer to the event structure (*TPMC851_IO_EVENTWAIT_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    int          ioLine;
    unsigned long flags;
    long         timeout;
} TPMC851_IO_EVENTWAIT_BUF;
```

ioLine

Specifies the digital I/O line where the event shall occur. Valid values are 0..15.

flags

Specifies the event that shall occur. This is an ored value of the following flags:

flag	description
<i>TPMC851_F_HI2LOTRANS</i>	If set, the function will return after a high to low transition occurs.
<i>TPMC851_F_LO2HITRANS</i>	If set, the function will return after a low to high transition occurs.

At least one flag must be specified.

timeout

Specifies the maximum time the function will wait for the specified event. The time is specified in ticks. Specify -1 to wait indefinitely for the given event.

EXAMPLE

```
#include "tpmc851.h"

int fd;
int result;
TPMC851_IO_EVENTWAIT_BUF waitBuf;

/*
** Wait for a transition on I/O line 12 (max wait 10000 ticks)
*/
waitBuf.ioLine = 12;
waitBuf.flags = TPMC851_F_HI2LOTRANS | TPMC851_F_LO2HITRANS;
waitBuf.timeout = 10000;

printf("Wait for an I/O event ... ");
result = ioctl(fd,
               TPMC851_IOC_IO_EVENTWAIT,
               (char*)&waitBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

ENOSPC	No space is available for new wait requests
ETIMEDOUT	The timer expired

3.3.15 TPMC851_IOC_IO_CONFIG

NAME

TPMC851_IOC_IO_CONFIG – Configure digital I/O direction

DESCRIPTION

This function configures digital I/O lines to input or output (direction).

A pointer to the configure structure (*TPMC851_IO_CONF_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned short      direction;
} TPMC851_IO_CONF_BUF;
```

direction

Specifies the new direction for digital I/O. A bit set to 1 enables output, a 0 means that the I/O line is input.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_IO_CONF_BUF ioConfBuf;

/* Enable line 0,2,8,9 for output, all other lines are input */
ioConfBuf.direction = (1 << 0) | (1 << 2) | (1 << 8) | (1 << 9);
printf("Set new I/O configuration ... ");
result = ioctl(   fd,
                  TPMC851_IOC_IO_CONFIG,
                  (char*)&ioConfBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

3.3.16 TPMC851_IOC_IO_DEBCONFIG

NAME

TPMC851_IOC_IO_DEBCONFIG – Configure digital input debouncer

DESCRIPTION

This function configures the digital I/O debouncing circuit.

A pointer to the configure structure (*TPMC851_IO_DEBCONF_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned short      enableMask;
    unsigned short      debTime;
} TPMC851_IO_DEBCONF_BUF;
```

enableMask

Specifies digital I/O lines which shall be observed by the debouncer. A bit set to 1 enables the debouncer, and a 0 disables the debouncer for the adequate I/O line.

debTime

Specifies the debounce time. The time is specified in 100ns steps.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;
TPMC851_IO_DEBCONF_BUF ioDebConfBuf;

/*
** Enable Debouncer for line 0 and 2 (debounce time 1ms)
*/
ioDebConfBuf.enableMask =  (1 << 0) | (1 << 2);
ioDebConfBuf.debTime =    10000;

...
```

```
...  
  
printf("Set debouncer configuration ... ");  
result = ioctl(fd,  
               TPMC851_IOC_IO_DEBCONFIG,  
               (char*)&ioDebConfBuf);  
  
if (result >= 1)  
{  
    printf("OK\n");  
}  
else  
{  
    /* process ioctl error */  
}
```

3.3.17 TPMC851_IOC_CNT_READ

NAME

`TPMC851_IOC_CNT_READ` – Read value from counter/timer

DESCRIPTION

This function reads the current value of the counter/timer.

A pointer to the read structure (`TPMC851_CNT_READ_BUF`) is passed by the parameter `arg` to the driver.

```
typedef struct
{
    unsigned long      count;
    unsigned long      state;
} TPMC851_CNT_READ_BUF;
```

`count`

Returns the actual counter value.

`state`

Returns the counter state. If possible the flags are cleared after read. This is an ored value of the following flags.

flag	description
<code>TPMC851_SF_CNTBORROW</code>	Counter borrow bit set (actual state)
<code>TPMC851_SF_CNTCARRY</code>	Counter carry bit set (actual state)
<code>TPMC851_SF_CNTMATCH</code>	Counter match event has occurred since last read.
<code>TPMC851_SF_CNTSIGN</code>	Counter sign bit (actual state)
<code>TPMC851_SF_CNTDIRECTION</code>	If set, counter direction is upward. If not set, counter direction is downward.
<code>TPMC851_SF_CNTLATCH</code>	Counter value has been latched.
<code>TPMC851_SF_CNTLATCHOVERFLOW</code>	Counter latch overflow has occurred.
<code>TPMC851_SF_CNTSNGLCYC</code>	Counter Single Cycle is active

EXAMPLE

```
#include "tpmc851.h"

int                      fd;
int                      result;
TPMC851_CNT_READ_BUF     cntBuf;

/* Read counter value */
printf("Read counter ... ");
result = ioctl(    fd,
                  TPMC851_IOC_CNT_READ,
                  (char*)&cntBuf);

if (result >= 1)
{
    printf("    Counter: %ld", cntBuf.counter);
    printf("    State:    %lxh", cntBuf.state);
}
else
{
    /* process ioctl error */
}
```

3.3.18 TPMC851_IOC_CNT_MATCHWAIT

NAME

TPMC851_IOC_CNT_MATCHWAIT – Wait for counter match event

DESCRIPTION

This function waits for a counter match event. This event occurs if the current timer/counter value matches the previously setup counter-match-register.

A pointer to the wait structure (*TPMC851_CNT_WAIT_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    long           timeout;
} TPMC851_CNT_WAIT_BUF;
```

timeout
Specifies the maximum time the function will wait for the match event. The time is specified in ticks. Specify -1 to wait indefinitely for the given event.

EXAMPLE

```
#include "tpmc851.h"

int                         fd;
int                         result;
TPMC851_CNT_WAIT_BUF        cntWaitBuf;

/*
 ** Wait for counter match event (max wait 10000 ticks)
 */
waitBuf.timeout = 10000;

...
```

```
...  
  
printf("Wait for counter match event ... ");  
result = ioctl(fd,  
               TPMC851_IOC_CNT_MATCHWAIT,  
               (char*)&cntWaitBuf);  
  
if (result >= 1)  
{  
    printf("OK\n");  
}  
else  
{  
    /* process ioctl error */  
}
```

ERRORS

ENOSPC	No space is available for new wait requests
ETIMEDOUT	The timer expired

3.3.19 TPMC851_IOC_CNT_CTRLWAIT

NAME

TPMC851_IOC_CNT_CTRLWAIT – Wait for counter control event

DESCRIPTION

This function waits for a counter control event. The event to wait for is chosen with ioctl() function *TPMC851_IOC_CNT_CONFIG* specifying the parameter *controlMode*.

A pointer to the wait structure (*TPMC851_CNT_WAIT_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    long           timeout;
} TPMC851_CNT_WAIT_BUF;
```

timeout

Specifies the maximum time the function will wait for the match event. The time is specified in ticks. Specify -1 to wait indefinitely for the given event.

EXAMPLE

```
#include "tpmc851.h"

int                         fd;
int                         result;
TPMC851_CNT_WAIT_BUF        cntWaitBuf;

/*
 ** Wait for counter control event (max wait 10000 ticks)
 */
waitBuf.timeout = 10000;

...
```

```
...  
  
printf("Wait for counter control event ... ");  
result = ioctl(fd,  
               TPMC851_IOC_CNT_CTRLWAIT,  
               (char*)&cntWaitBuf);  
  
if (result >= 1)  
{  
    printf("OK\n");  
}  
else  
{  
    /* process ioctl error */  
}
```

ERRORS

ENOSPC	No space is available for new wait requests
ETIMEDOUT	The timer expired

3.3.20 TPMC851_IOC_CNT_CONFIG

NAME

TPMC851_IOC_CNT_CONFIG – Configure counter

DESCRIPTION

This function configures the counter.

A pointer to the configuration structure (*TPMC851_CNT_CONFIG_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned long      inputMode;
    int                clockDivider;
    unsigned long      countMode;
    unsigned long      controlMode;
    unsigned long      invFlags;
} TPMC851_CNT_CONFIG_BUF;
```

inputMode

Specifies the counter input mode. The following modes are defined and valid:

flag	description
<i>TPMC851_M_CNTIN_DISABLE</i>	Counter disabled
<i>TPMC851_M_CNTIN_TIMERUP</i>	Timer Mode Up
<i>TPMC851_M_CNTIN_TIMERDOWN</i>	Timer Mode Down
<i>TPMC851_M_CNTIN_DIRCOUNT</i>	Direction Count
<i>TPMC851_M_CNTIN_UPDOWNCOUNT</i>	Up/Down Count
<i>TPMC851_M_CNTIN_QUAD1X</i>	Quadrature Count 1x
<i>TPMC851_M_CNTIN_QUAD2X</i>	Quadrature Count 2x
<i>TPMC851_M_CNTIN_QUAD3X</i>	Quadrature Count 4x

clockDivider

Specifies clock divider. Allowed clock divider values are 1 (40MHz), 2 (20MHz), 4 (10MHz) and 8 (5MHz).

countMode

Specifies the count mode. The following modes are defined and valid:

flag	description
<i>TPMC851_M_CNT_CYCLE</i>	Cycling Counter
<i>TPMC851_M_CNT_DIVN</i>	Divide-by-N
<i>TPMC851_M_CNT_SINGLE</i>	Single Cycle

controlMode

Specifies the counter control mode. These events can generate counter control events. The following modes are defined and valid:

flag	description
<i>TPMC851_M_CNTCTRL_NONE</i>	No Control Mode
<i>TPMC851_M_CNTCTRL_LOAD</i>	Load Mode
<i>TPMC851_M_CNTCTRL_LATCH</i>	Latch Mode
<i>TPMC851_M_CNTCTRL_GATE</i>	Gate Mode
<i>TPMC851_M_CNTCTRL_RESET</i>	Reset Mode

invFlags

Specifies if counter input lines shall be inverted or not. This is an ored value of the following flags:

flag	description
<i>TPMC851_F_CNTINVINP2</i>	If set, input line 2 is low active If not set, input line 2 is high active
<i>TPMC851_F_CNTINVINP3</i>	If set, input line 3 is low active If not set, input line 3 is high active
<i>TPMC851_F_CNTINVINP4</i>	If set, input line 4 is low active If not set, input line 4 is high active

EXAMPLE

```
#include "tpmc851.h"

int fd;
int result;
TPMC851_CNT_CONFIG_BUF cntConfBuf;

/*
** Setup counter for direction count, clock divider 1, cycling count,
** no control mode and all line high active
*/
cntConfBuf. inputMode = TPMC851_M_CNTIN_DIRCOUNT;
cntConfBuf. clockDivider = 1;
cntConfBuf. countMode = TPMC851_M_CNT_CYCLE;
cntConfBuf. controlMode = TPMC851_M_CNTCTRL_NONE;
cntConfBuf. invFlags = 0;

printf("Set counter configuration ... ");
result = ioctl(fd,
               TPMC851_IOC_CNT_CONFIG,
               (char*)&cntConfBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

ERRORS

EINVAL	Specified flag or mode is invalid.
--------	------------------------------------

3.3.21 TPMC851_IOC_CNT_RESET

NAME

TPMC851_IOC_CNT_RESET – Reset counter value

DESCRIPTION

This function resets the counter value to 0x00000000.

No additional parameter is necessary for this function.

EXAMPLE

```
#include "tpmc851.h"

int                  fd;
int                  result;

/* Reset counter */
printf("Reset counter ... ");
result = ioctl(fd,
               TPMC851_IOC_CNT_RESET,
               NULL);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

3.3.22 TPMC851_IOC_CNT_SETPRELD

NAME

TPMC851_IOC_CNT_SETPRELD – Set counter preload value

DESCRIPTION

This function sets the counter preload register.

A pointer to the preload structure (*TPMC851_CNT_SETPRELD_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned long          value;
    unsigned long          flags;
} TPMC851_CNT_SETPRELD_BUF;
```

value
Specifies the new counter preload value.

flags
Is an ored value of the following flags:

flag	description
<i>TPMC851_F_IMMPRELOAD</i>	If set, the function will immediate load the preload value into the counter
	If not set, preload value will be used for the next preload condition.

EXAMPLE

```
#include "tpmc851.h"

int                      fd;
int                      result;
TPMC851_CNT_SETPRELD_BUF cntPrldBuf;

/*
 ** Immediately load 0x11223344 into the counter and preload register
 */
cntPrldBuf. value        = 0x11223344;
cntPrldBuf. flags        = TPMC851_F_IMMPRELOAD;

...
```

```
...  
  
printf("Set preload value ... ");  
result = ioctl(fd,  
              TPMC851_IOC_CNT_SETPRELD,  
              (char*)&cntPrldBuf);  
  
if (result >= 1)  
{  
    printf("OK\n");  
}  
else  
{  
    /* process ioctl error */  
}
```

3.3.23 TPMC851_IOC_CNT_SETMATCH

NAME

TPMC851_IOC_CNT_SETMATCH – Set counter match value

DESCRIPTION

This function sets the counter match register. If counter and match value are the same, a match event occurs. The driver can wait for this event (refer to ioctl function *TPMC851_IOC_CNT_MATCHWAIT*).

A pointer to the match structure (*TPMC851_CNT_SETMATCH_BUF*) is passed by the parameter *arg* to the driver.

```
typedef struct
{
    unsigned long          value;
} TPMC851_CNT_SETMATCH_BUF;
```

value
Specifies the new counter match value.

EXAMPLE

```
#include "tpmc851.h"

int                      fd;
int                      result;
TPMC851_CNT_SETMATCH_BUF cntMatchBuf;

/* Set match value to 0x10000 */
cntMatchBuf.value        = 0x10000;
printf("Set counter match value ... ");
result = ioctl(fd,
               TPMC851_IOC_CNT_SETMATCH,
               (char*)&cntMatchBuf);

if (result >= 1)
{
    printf("OK\n");
}
else
{
    /* process ioctl error */
}
```

4 Diagnostic

If the TPMC851 does not work properly it is helpful to get some status information from the driver respective kernel.

The Linux /proc file system provides information about kernel, resources, driver, devices and so on. The following screen dumps displays information of a correct running TPMC851 driver (see also the proc man pages).

```
